

# PCM3140-Q1 Quad-Channel, 768-kHz, Burr-Brown™ Audio ADC

## 1 Features

- Multichannel high-performance ADC:
  - 4-channel analog microphones or line-in,
  - 8-channel digital PDM microphones, or
  - Combination of analog and digital microphones
- ADC line and microphone differential input performance:
  - Dynamic range (DR): 106dB
  - 
  - THD+N: –98dB
- ADC channel summing mode, DR performance:
  - 109dB, 2-channel summing
  - 112dB, 4-channel summing
- ADC input voltage:
  - Differential, 2V<sub>RMS</sub> full-scale inputs
  - Single-ended, 1V<sub>RMS</sub> full-scale inputs
- ADC sample rate (f<sub>S</sub>) = 8kHz to 768kHz
- Programmable channel settings:
  - Channel gain: 0dB to 42dB, 1dB steps
  - Digital volume control: –100dB to 27dB
  - Gain calibration with 0.1dB resolution
  - Phase calibration with 163ns resolution
- Programmable microphone bias or supply voltage generation
- Low-latency signal processing filter selection
- Programmable HPF and biquad digital filters
- Automatic gain controller (AGC)
- I<sup>2</sup>C or SPI controls
- Integrated high-performance audio PLL
- Automatic clock divider setting configurations
- Audio serial data interface:
  - Format: TDM, I<sup>2</sup>S, or left-justified (LJ)
  - Word length: 16 bits, 20 bits, 24 bits, or 32 bits
  - Controller or target interface
- Single-supply operation: 3.3V or 1.8V
- I/O-supply operation: 3.3V or 1.8V
- Power consumption for 1.8V AVDD supply:
  - 8.5mW/channel at 16kHz sample rate
  - 9.2mW/channel at 48kHz sample rate

## 2 Applications

- Microphone array systems
- Voice-activated digital assistants
- Teleconferencing systems
- Security and surveillance systems

## 3 Description

The PCM3140-Q1 is a Burr-Brown™ high-performance, audio analog-to-digital converter (ADC) that supports simultaneous sampling of up to four analog channels or eight digital channels for the pulse density modulation (PDM) microphone input. The device supports line and microphone inputs, and allows for both single-ended and differential input configurations. The device integrates programmable channel gain, digital volume control, a programmable microphone bias voltage, a phase-locked loop (PLL), a programmable high-pass filter (HPF), biquad filters, low-latency filter modes, and allows for sample rates up to 768kHz, and allows for sample rates up to 192kHz. The device supports time-division multiplexing (TDM), I<sup>2</sup>S, or left-justified (LJ) audio formats, and can be controlled with either the I<sup>2</sup>C or SPI. These integrated high-performance features, along with the ability to be powered from a single-supply of 3.3V or 1.8V, make the device an excellent choice for space-constrained audio systems in far-field microphone recording applications.

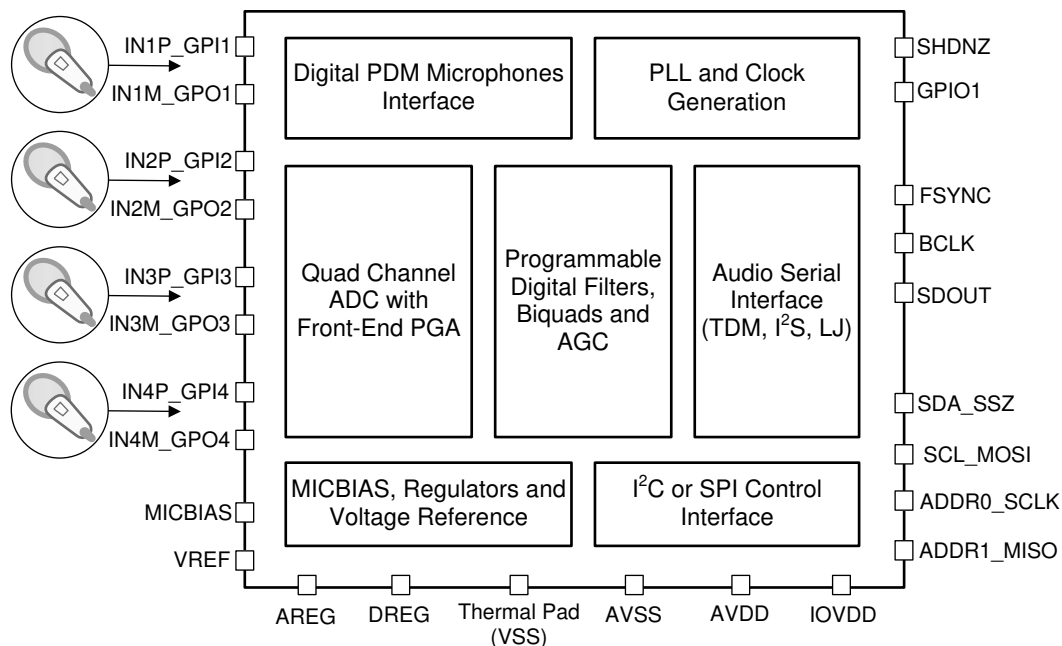

The PCM3140-Q1 is specified from –40°C to +125°C, and is offered in a 24-pin VQFN package.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	PACKAGE SIZE <sup>(2)</sup>	BODY SIZE (NOM)
PCM3140-Q1	VQFN (24)	4.00mm × 4.00mm	4.00mm × 4.00mm with 0.5mm pitch

- (1) For all available packages, see the package option addendum at the end of the data sheet.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

## 4 Device Comparison Table

FEATURES	PCM3140-Q1	PCM5140-Q1	PCM6140-Q1
Control interface	I <sup>2</sup> C or SPI		
Digital audio serial interface	TDM, I <sup>2</sup> S, or left-justified (LJ)		
Audio analog channel	4	4	4
Digital PDM channel	8	8	8
Dynamic range enhancer (DRE)	Not available	Available	Available
Dynamic range (DRE disabled)	106dB	108dB	113dB
Dynamic range (DRE enabled)	Not available	120dB	123dB
Compatibility	Pin-to-pin, package, and control registers compatible; drop-in replacements of each other		
Package	VQFN (RGE), 24-pin, 4.00mm × 4.00mm (0.5mm pitch)		

## 5 Pin Configuration and Functions

**Figure 5-1. RGE Package 24-Pin VQFN With Exposed Thermal Pad Top View**

**Table 5-1. Pin Functions**

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	AVDD	Analog supply	Analog power (1.8V or 3.3V, nominal)
2	AREG	Analog supply	Analog on-chip regulator output voltage for analog supply (1.8V, nominal) or external analog power (1.8V, nominal)
3	VREF	Analog	Analog reference voltage filter output
4	AVSS	Analog supply	Analog ground. Short this pin directly to the board ground plane.
5	MICBIAS	Analog	MICBIAS output
6	IN1P_GPI1	Analog input/digital input	Analog input 1P pin or general-purpose digital input 1 (multipurpose functions such as digital microphone data, PLL input clock source, and so forth)
7	IN1M_GPO1	Analog input/digital output	Analog input 1M pin or general-purpose digital output 1 (multipurpose functions such as digital microphone clock, interrupt, and so forth)
8	IN2P_GPI2	Analog input/digital input	Analog input 2P pin or general-purpose digital input 2 (multipurpose functions such as digital microphones data, PLL input clock source, and so forth)
9	IN2M_GPO2	Analog input/digital output	Analog input 2M pin or general-purpose digital output 2 (multipurpose functions such as digital microphone clock, interrupt, and so forth)
10	IN3P_GPI3	Analog input/digital input	Analog input 3P pin or general-purpose digital input 3 (multipurpose functions such as digital microphones data, PLL input clock source, and so forth)
11	IN3M_GPO3	Analog input/digital output	Analog input 3M pin or general-purpose digital output 3 (multipurpose functions such as digital microphone clock, interrupt, and so forth)
12	IN4P_GPI4	Analog input/digital input	Analog input 4P pin or general-purpose digital input 4 (multipurpose functions such as digital microphones data, PLL input clock source, and so forth)
13	IN4M_GPO4	Analog input/digital output	Analog input 4M pin or general-purpose digital output 4 (multipurpose functions such as digital microphone clock, interrupt, and so forth)
14	SHDNZ	Digital input	Device hardware shutdown and reset (active low)
15	ADDR1_MISO	Digital I/O	For I <sup>2</sup> C operation: I <sup>2</sup> C target address A1 pin For SPI operation: SPI target output pin
16	ADDR0_SCLK	Digital input	For I <sup>2</sup> C operation: I <sup>2</sup> C target address A0 pin For SPI operation : SPI serial bit clock

**Table 5-1. Pin Functions (continued)**

PIN		TYPE	DESCRIPTION
NO.	NAME		
17	SCL_MOSI	Digital input	For I <sup>2</sup> C operation: clock pin for I <sup>2</sup> C control bus For SPI operation: SPI target input pin
18	SDA_SSZ	Digital I/O	For I <sup>2</sup> C operation: data pin for I <sup>2</sup> C control bus For SPI operation: SPI target-select pin
19	IOVDD	Digital supply	Digital I/O power supply (1.8V or 3.3V, nominal)
20	GPIO1	Digital I/O	General-purpose digital input/output 1 (multipurpose functions such as digital microphones clock or data, PLL input clock source, interrupt, and so forth)
21	SDOUT	Digital output	Audio serial data interface bus output
22	BCLK	Digital I/O	Audio serial data interface bus bit clock
23	FSYNC	Digital I/O	Audio serial data interface bus frame synchronization signal
24	DREG	Digital supply	Digital regulator output voltage for digital core supply (1.5V, nominal)
A1,A2,A3,A4	AVSS	Analog supply	Analog ground. Short this pin directly to the board ground plane.
Thermal Pad	Thermal Pad (VSS)	Ground supply	Thermal pad shorted to internal device ground. Short the thermal pad directly to the board ground plane.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over the operating ambient temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	AVDD to AVSS	−0.3	3.9	V
	AREG to AVSS	−0.3	2.0	
	IOVDD to VSS (thermal pad)	−0.3	3.9	
Ground voltage differences	AVSS to VSS (thermal pad)	−0.3	0.3	V
Analog input voltage	Analog input pins voltage to AVSS	−0.3	AVDD + 0.3	V
Digital input voltage	Digital input except INxP_GPIx pins voltage to VSS (thermal pad)	−0.3	IOVDD + 0.3	V
	Digital input INxP_GPIx pins voltage to VSS (thermal pad)	−0.3	AVDD + 0.3	
Temperature	Operating ambient, T <sub>A</sub>	−40	125	°C
	Junction, T <sub>J</sub>	−40	150	
	Storage, T <sub>stg</sub>	−65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
POWER					
AVDD, AREG <sup>(1)</sup>	Analog supply voltage AVDD to AVSS (AREG is generated using onchip regulator) - AVDD 3.3-V operation	3.0	3.3	3.6	V
	Analog supply voltage AVDD and AREG to AVSS (AREG internal regulator is shutdown) - AVDD 1.8-V operation	1.7	1.8	1.9	
IOVDD	IO supply voltage to VSS (thermal pad) - IOVDD 3.3-V operation	3.0	3.3	3.6	V
	IO supply voltage to VSS (thermal pad) - IOVDD 1.8-V operation	1.65	1.8	1.95	
INPUTS					
	Analog input pins voltage to AVSS	0		AVDD	V
	Digital input except INxP_GPIx pins voltage to VSS (thermal pad)	0		IOVDD	V
	Digital input INxP_GPIx pins voltage to VSS (thermal pad)	0		AVDD	V
TEMPERATURE					
T <sub>A</sub>	Operating ambient temperature	−40		125	°C
OTHERS					
	GPIOx or GPIx (used as MCLK input) clock frequency			36.864 <sup>(2)</sup>	MHz
C <sub>b</sub>	SCL and SDA bus capacitance for I <sup>2</sup> C interface supports standard-mode and fast-mode			400	pF
	SCL and SDA bus capacitance for I <sup>2</sup> C interface supports fast-mode plus			550	
C <sub>L</sub>	Digital output load capacitance		20	50	pF

- (1) AVSS and VSS (thermal pad): all ground pins must be tied together and must not differ in voltage by more than 0.2 V.

- (2) MCLK input rise time ( $V_{IL}$  to  $V_{IH}$ ) and fall time ( $V_{IH}$  to  $V_{IL}$ ) must be less than 5 ns. For better audio noise performance, MCLK input must be used with low jitter.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		PCM3140-Q1	UNIT
		RGE (VQFN)	
		24 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	45.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	30	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	22.5	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.8	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	22.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	15	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

at  $T_A = 25^\circ\text{C}$ ,  $AVDD = 3.3\text{ V}$ ,  $IOVDD = 3.3\text{ V}$ ,  $f_{IN} = 1\text{-kHz}$  sinusoidal signal,  $f_S = 48\text{ kHz}$ , 32-bit audio data, BCLK =  $256 \times f_S$ , TDM slave mode, PLL on (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ADC CONFIGURATION						
	AC input impedance	Input pins INxP or INxM, 2.5-kΩ input impedance selection		2.5		kΩ
		Input pins INxP or INxM, 10-kΩ input impedance selection		10		
		Input pins INxP or INxM, 20-kΩ input impednace selection		20		
	Channel gain range	Programmable range with 1-dB steps	0		42	dB
ADC PERFORMANCE FOR LINE/MICROPHONE INPUT RECORDING : AVDD 3.3-V OPERATION						
	Differential input full-scale AC signal voltage	AC-coupled input		2		V <sub>RMS</sub>
	Single-ended input full-scale AC signal voltage	AC-coupled input		1		V <sub>RMS</sub>
SNR	Signal-to-noise ratio, A-weighted <sup>(1) (2)</sup>	IN1 differential input selected and AC signal shorted to ground, 10-kΩ input impedance selection, 0-dB channel gain	100	106		dB
		IN1 differential input selected and AC signal shorted to ground, 10-kΩ input impedance selection, 12-dB channel gain		102		
DR	Dynamic range, A-weighted <sup>(2)</sup>	IN1 differential input selected and –60-dB full-scale AC signal input, 10-kΩ input impedance selection, 0-dB channel gain		107		dB
		IN1 differential input selected and –72-dB full-scale AC signal input, 10-kΩ input impedance selection, 12-dB channel gain		103		
THD+N	Total harmonic distortion <sup>(2) (3)</sup>	IN1 differential input selected and –1-dB full-scale AC signal input, 10-kΩ input impedance selection, 0-dB channel gain		–98	–80	dB
		IN1 differential input selected and –13-dB full-scale AC signal input, 10-kΩ input impedance selection, 12-dB channel gain		–94		
ADC PERFORMANCE FOR LINE/MICROPHONE INPUT RECORDING : AVDD 1.8-V OPERATION						
	Differential input full-scale AC signal voltage	AC-coupled Input		1		V <sub>RMS</sub>
	Single-ended input full-scale AC signal voltage	AC-coupled Input		0.5		V <sub>RMS</sub>

at  $T_A = 25^\circ\text{C}$ ,  $AVDD = 3.3\text{ V}$ ,  $IOVDD = 3.3\text{ V}$ ,  $f_{IN} = 1\text{-kHz}$  sinusoidal signal,  $f_S = 48\text{ kHz}$ , 32-bit audio data,  $BCLK = 256 \times f_S$ , TDM slave mode, PLL on (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SNR	Signal-to-noise ratio, A-weighted <sup>(1) (2)</sup>	IN1 differential input selected and AC signal shorted to ground, 10-k $\Omega$ input impedance selection, 0-dB channel gain		100		dB
DR	Dynamic range, A-weighted <sup>(2)</sup>	IN1 differential input selected and –60-dB full-scale AC signal input, 10-k $\Omega$ input impedance selection, 0-dB channel gain		101		dB
THD+N	Total harmonic distortion <sup>(2) (3)</sup>	IN1 differential input selected and –2-dB full-scale AC signal input, 10-k $\Omega$ input impedance selection, 0 dB channel gain		–90		dB
<b>ADC OTHER PARAMETERS</b>						
	Digital volume control range	Programmable 0.5-dB steps	–100		27	dB
	Output data sample rate	Programmable	7.35		768	kHz
	Output data sample word length	Programmable	16		32	Bits
	Digital high-pass filter cutoff frequency	First-order IIR filter with programmable coefficients, –3-dB point (default setting)		12		Hz
	Interchannel isolation	–1-dB full-scale AC-signal input to non measurement channel		–124		dB
	Interchannel gain mismatch	–6-dB full-scale AC-signal input and 0-dB channel gain		0.1		dB
	Gain drift	0-dB channel gain, across temperature range 15°C to 35°C		–4.4		ppm/°C
	Interchannel phase mismatch	1-kHz sinusoidal signal		0.02		Degrees
	Phase drift	1-kHz sinusoidal signal, across temperature range 15°C to 35°C		0.0005		Degrees/°C
PSRR	Power-supply rejection ratio	100-mV <sub>PP</sub> , 1-kHz sinusoidal signal on AVDD, differential input selected, 0-dB channel gain		102		dB
CMRR	Common-mode rejection ratio	Differential microphone input selected, 0-dB channel gain, 100-mV <sub>PP</sub> , 1-kHz signal on both pins and measure level at output		60		dB
<b>MICROPHONE BIAS</b>						
	MICBIAS noise	BW = 20 Hz to 20 kHz, A-weighted, 1- $\mu\text{F}$ capacitor between MICBIAS and AVSS		1.6		$\mu\text{V}_{\text{RMS}}$
	MICBIAS voltage	MICBIAS programmed to VREF and VREF programmed to either 2.75 V, 2.5 V, or 1.375 V		VREF		V
		MICBIAS programmed to VREF $\times$ 1.096 and VREF programmed to either 2.75 V, 2.5 V, or 1.375 V		VREF $\times$ 1.096		
		Bypass to AVDD with 20-mA load		AVDD – 0.2		
	MICBIAS current drive	MICBIAS voltage $\geq 2.5\text{ V}$			20	mA
		MICBIAS voltage $< 2.5\text{ V}$			10	
	MICBIAS load regulation	MICBIAS programmed to either VREF or VREF $\times$ 1.096, measured up to max load	0	0.6	1.8	%
	MICBIAS over current protection threshold		25			mA
<b>DIGITAL I/O</b>						
$V_{IL(\text{SHDNZ})}$	Low-level digital input logic voltage threshold	SHDNZ pin	–0.3		$0.25 \times \text{IOVDD}$	V
$V_{IH(\text{SHDNZ})}$	High-level digital input logic voltage threshold	SHDNZ pin	$0.75 \times \text{IOVDD}$		$\text{IOVDD} + 0.3$	V
$V_{IL}$	Low-level digital input logic voltage threshold	All digital pins except INxP_GPIx, SDA and SCL, IOVDD 1.8-V operation	–0.3		$0.35 \times \text{IOVDD}$	V
		All digital pins except INxP_GPIx, SDA and SCL, IOVDD 3.3-V operation	–0.3		0.8	
$V_{IH}$	High-level digital input logic voltage threshold	All digital pins except INxP_GPIx, SDA and SCL, IOVDD 1.8-V operation	$0.65 \times \text{IOVDD}$		$\text{IOVDD} + 0.3$	V
		All digital pins except INxP_GPIx, SDA and SCL, IOVDD 3.3-V operation	2		$\text{IOVDD} + 0.3$	

at  $T_A = 25^\circ\text{C}$ ,  $AVDD = 3.3\text{ V}$ ,  $IOVDD = 3.3\text{ V}$ ,  $f_{IN} = 1\text{-kHz}$  sinusoidal signal,  $f_S = 48\text{ kHz}$ , 32-bit audio data,  $BCLK = 256 \times f_S$ , TDM slave mode, PLL on (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{OL}$	Low-level digital output voltage	All digital pins except INxM_GPOx, SDA and SCL, $I_{OL} = -2\text{ mA}$ , IOVDD 1.8-V operation			0.45	V
		All digital pins except INxM_GPOx, SDA and SCL, $I_{OL} = -2\text{ mA}$ , IOVDD 3.3-V operation			0.4	
$V_{OH}$	High-level digital output voltage	All digital pins except INxM_GPOx, SDA and SCL, $I_{OH} = 2\text{ mA}$ , IOVDD 1.8-V operation	IOVDD – 0.45			V
		All digital pins except INxM_GPOx, SDA and SCL, $I_{OH} = 2\text{ mA}$ , IOVDD 3.3-V operation	2.4			
$V_{IL(I2C)}$	Low-level digital input logic voltage threshold	SDA and SCL	–0.5	$0.3 \times \text{IOVDD}$		V
$V_{IH(I2C)}$	High-level digital input logic voltage threshold	SDA and SCL	$0.7 \times \text{IOVDD}$	$\text{IOVDD} + 0.5$		V
$V_{OL1(I2C)}$	Low-level digital output voltage	SDA, $I_{OL(I2C)} = -3\text{ mA}$ , IOVDD > 2 V			0.4	V
$V_{OL2(I2C)}$	Low-level digital output voltage	SDA, $I_{OL(I2C)} = -2\text{ mA}$ , IOVDD $\leq 2\text{ V}$		$0.2 \times \text{IOVDD}$		V
$I_{OL(I2C)}$	Low-level digital output current	SDA, $V_{OL(I2C)} = 0.4\text{ V}$ , standard-mode or fast-mode	3			mA
		SDA, $V_{OL(I2C)} = 0.4\text{ V}$ , fast-mode plus	20			
$I_{IH}$	Input logic-high leakage for digital inputs	All digital pins except INxP_GPIx pins, input = IOVDD	–5	0.1	5	$\mu\text{A}$
$I_{IL}$	Input logic-low leakage for digital inputs	All digital pins except INxP_GPIx pins, input = 0 V	–5	0.1	5	$\mu\text{A}$
$V_{IL(GPIx)}$	Low-level digital input logic voltage threshold	All INxP_GPIx digital pins, AVDD 1.8-V operation	–0.3	$0.35 \times \text{AVDD}$		V
		All INxP_GPIx digital pins, AVDD 3.3-V operation	–0.3		0.8	
$V_{IH(GPIx)}$	High-level digital input logic voltage threshold	All INxP_GPIx digital pins, AVDD 1.8-V operation	$0.65 \times \text{AVDD}$	$\text{AVDD} + 0.3$		V
		All INxP_GPIx digital pins, AVDD 3.3-V operation	2	$\text{AVDD} + 0.3$		
$V_{OL(GPOx)}$	Low-level digital output voltage	All INxM_GPOx digital pins, $I_{OL} = -2\text{ mA}$ , AVDD 1.8-V operation			0.45	V
		All INxM_GPOx digital pins, $I_{OL} = -2\text{ mA}$ , AVDD 3.3-V operation			0.4	
$V_{OH(GPOx)}$	High-level digital output voltage	All INxM_GPOx digital pins, $I_{OH} = 2\text{ mA}$ , AVDD 1.8-V operation	$\text{AVDD} - 0.45$			V
		All INxM_GPOx digital pins, $I_{OH} = 2\text{ mA}$ , AVDD 3.3-V operation	2.4			
$I_{IH(GPIx)}$	Input logic-high leakage for digital inputs	All INxP_GPIx digital pins, input = AVDD	–5	0.1	5	$\mu\text{A}$
$I_{IL(GPIx)}$	Input logic-high leakage for digital inputs	All INxP_GPIx digital pins, input = 0 V	–5	0.1	5	$\mu\text{A}$
$C_{IN}$	Input capacitance for digital inputs	All digital pins		5		pF
$R_{PD}$	Pulldown resistance for digital I/O pins when asserted on			20		k $\Omega$

#### TYPICAL SUPPLY CURRENT CONSUMPTION

$I_{AVDD}$	Current consumption in hardware shutdown mode	SHDNZ = 0, AVDD = 3.3 V, internal AREG	0.5	$\mu\text{A}$
$I_{AVDD}$		SHDNZ = 0, AVDD = 1.8 V, external AREG supply (AREG shorted to AVDD)	0.5	
$I_{IOVDD}$		SHDNZ = 0, all external clocks stopped, IOVDD = 3.3 V	0.1	
$I_{IOVDD}$		SHDNZ = 0, all external clocks stopped, IOVDD = 1.8 V	0.1	
$I_{AVDD}$	Current consumption in sleep mode (software shutdown mode)	All external clocks stopped, AVDD = 3.3 V, internal AREG	5	$\mu\text{A}$
$I_{AVDD}$		All external clocks stopped, AVDD = 1.8 V, external AREG supply (AREG shorted to AVDD)	5	
$I_{IOVDD}$		All external clocks stopped, IOVDD = 3.3 V	0.5	
$I_{IOVDD}$		All external clocks stopped, IOVDD = 1.8 V	0.5	

at  $T_A = 25^\circ\text{C}$ ,  $AVDD = 3.3\text{ V}$ ,  $IOVDD = 3.3\text{ V}$ ,  $f_{IN} = 1\text{-kHz}$  sinusoidal signal,  $f_S = 48\text{ kHz}$ , 32-bit audio data,  $BCLK = 256 \times f_S$ , TDM slave mode, PLL on (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{AVDD}$	Current consumption with ADC 2-channel operating at $f_S = 48\text{-kHz}$ , PLL off and $BCLK = 512 \times f_S$	$AVDD = 3.3\text{ V}$ , internal AREG		11.7		mA
$I_{AVDD}$		$AVDD = 1.8\text{ V}$ , external AREG supply (AREG shorted to $AVDD$ )		11.0

$I_{AVDD}$	Current consumption with ADC 4-channel operating at $f_S = 48\text{-kHz}$ , PLL on and $BCLK = 256 \times f_S$	$AVDD = 3.3\text{ V}$ , internal AREG		21.3		mA
$I_{AVDD}$		$AVDD = 1.8\text{ V}$ , external AREG supply (AREG shorted to $AVDD$ )		20.2		
$I_{IOVDD}$		$IOVDD = 3.3\text{ V}$		0.25		
$I_{IOVDD}$		$IOVDD = 1.8\text{ V}$		0.15		

- (1) Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the AC signal input shorted to ground, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
- (2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.
- (3) For best distortion performance, use input AC-coupling capacitors with low-voltage-coefficient.

## 6.6 Timing Requirements: I<sup>2</sup>C Interface

at T<sub>A</sub> = 25°C, IOVDD = 3.3 V or 1.8 V (unless otherwise noted); see [Figure 6-1](#) for timing diagram

		MIN	NOM	MAX	UNIT
<b>STANDARD-MODE</b>					
f <sub>SCL</sub>	SCL clock frequency	0		100	kHz
t <sub>HD;STA</sub>	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	4			μs
t <sub>LOW</sub>	Low period of the SCL clock	4.7			μs
t <sub>HIGH</sub>	High period of the SCL clock	4			μs
t <sub>SU;STA</sub>	Setup time for a repeated START condition	4.7			μs
t <sub>HD;DAT</sub>	Data hold time	0		3.45	μs
t <sub>SU;DAT</sub>	Data setup time	250			ns

t <sub>r</sub>	SDA and SCL rise time	20		300	ns
t <sub>f</sub>	SDA and SCL fall time	20 × (IOVDD / 5.5 V)		300	ns
t <sub>SU;STO</sub>	Setup time for STOP condition	0.6			μs
t <sub>BUF</sub>	Bus free time between a STOP and START condition	1.3			μs
<b>FAST-MODE PLUS</b>					
f <sub>SCL</sub>	SCL clock frequency	0		1000	kHz
t <sub>HD;STA</sub>	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	0.26			μs
t <sub>LOW</sub>	Low period of the SCL clock	0.5			μs
t <sub>HIGH</sub>	High period of the SCL clock	0.26			μs
t <sub>SU;STA</sub>	Setup time for a repeated START condition	0.26			μs
t <sub>HD;DAT</sub>	Data hold time	0			μs
t <sub>SU;DAT</sub>	Data setup time	50			ns
t <sub>r</sub>	SDA and SCL rise time			120	ns
t <sub>f</sub>	SDA and SCL fall time	20 × (IOVDD / 5.5 V)		120	ns
t <sub>SU;STO</sub>	Setup time for STOP condition	0.26			μs
t <sub>BUF</sub>	Bus free time between a STOP and START condition	0.5			μs

## 6.7 Switching Characteristics: I<sup>2</sup>C Interface

at T<sub>A</sub> = 25°C, IOVDD = 3.3 V or 1.8 V (unless otherwise noted); see [Figure 6-1](#) for timing diagram

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>d</sub> (SDA)	Standard-mode	250		1250	ns
	Fast-mode	250		850	
	Fast-mode plus			400	

## 6.8 Timing Requirements: SPI Interface

at T<sub>A</sub> = 25°C, IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see [Figure 6-2](#) for timing diagram

		MIN	NOM	MAX	UNIT
t <sub>(SCLK)</sub>	SCLK period	40			ns
t <sub>H</sub> (SCLK)	SCLK high pulse duration	18			ns
t <sub>L</sub> (SCLK)	SCLK low pulse duration	18			ns
t <sub>LEAD</sub>	Enable lead time	16			ns
t <sub>TRAIL</sub>	Enable trail time	16			ns
t <sub>DSEQ</sub>	Sequential transfer delay	20			ns
t <sub>SU</sub> (MOSI)	MOSI data setup time	8			ns
t <sub>HLD</sub> (MOSI)	MOSI data hold time	8			ns
t <sub>r</sub> (SCLK)	SCLK rise time	10% - 90% rise time		6	ns
t <sub>f</sub> (SCLK)	SCLK fall time	90% - 10% fall time		6	ns

## 6.9 Switching Characteristics: SPI Interface

at T<sub>A</sub> = 25°C, IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see [Figure 6-2](#) for timing diagram

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>a</sub> (MISO)	MISO access time			16	ns
t <sub>d</sub> (MISO)	SCLK to MISO delay	50% of SCLK to 50% of MISO		16	ns
t <sub>dis</sub> (MISO)	MISO disable time			20	ns

## 6.10 Timing Requirements: TDM, I<sup>2</sup>S or LJ Interface

at T<sub>A</sub> = 25°C, IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see [Figure 6-3](#) for timing diagram

		MIN	NOM	MAX	UNIT
t <sub>(BCLK)</sub>	BCLK period	40			ns
t <sub>H</sub> (BCLK)	BCLK high pulse duration <sup>(1)</sup>	18			ns
t <sub>L</sub> (BCLK)	BCLK low pulse duration <sup>(1)</sup>	18			ns
t <sub>SU</sub> (FSYNC)	FSYNC setup time	8			ns
t <sub>HLD</sub> (FSYNC)	FSYNC hold time	8			ns
t <sub>r</sub> (BCLK)	BCLK rise time	10% - 90% rise time		10	ns
t <sub>f</sub> (BCLK)	BCLK fall time	90% - 10% fall time		10	ns

(1) The BCLK minimum high or low pulse duration must be higher than 25 ns (to meet the timing specifications), if the SDOUT data line is latched on the opposite BCLK edge polarity than the edge used by the device to transmit SDOUT data.

## 6.11 Switching Characteristics: TDM, I<sup>2</sup>S or LJ Interface

at T<sub>A</sub> = 25°C, IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see [Figure 6-3](#) for timing diagram

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>d</sub> (SDOUT-BCLK)	BCLK to SDOUT delay	50% of BCLK to 50% of SDOUT		18	ns

at  $T_A = 25^\circ\text{C}$ , IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see Figure 6-3 for timing diagram

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{d(\text{SDOUT-FSYNC})}$	FSYNC to SDOUT delay in TDM or LJ mode (for MSB data with TX_OFFSET = 0)			18	ns
$f_{(\text{BCLK})}$	BCLK output clock frequency: master mode (1)			24.576	MHz
$t_{H(\text{BCLK})}$	BCLK high pulse duration: master mode	14			ns
$t_{L(\text{BCLK})}$	BCLK low pulse duration: master mode	14			ns
$t_{d(\text{FSYNC})}$	BCLK to FSYNC delay: master mode			18	ns
$t_{r(\text{BCLK})}$	BCLK rise time: master mode			8	ns
$t_{f(\text{BCLK})}$	BCLK fall time: master mode			8	ns

- (1) The BCLK output clock frequency must be lower than 18.5 MHz (to meet the timing specifications), if the SDOUT data line is latched on the opposite BCLK edge polarity than the edge used by the device to transmit SDOUT data.

## 6.12 Timing Requirements: PDM Digital Microphone Interface

at  $T_A = 25^\circ\text{C}$ , IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see Figure 6-4 for timing diagram

		MIN	NOM	MAX	UNIT
$t_{\text{SU}}(\text{PDM DINx})$	PDM DINx setup time	30			ns
$t_{\text{HLD}}(\text{PDM DINx})$	PDM DINx hold time	0			ns

## 6.13 Switching Characteristics: PDM Digital Microphone Interface

at  $T_A = 25^\circ\text{C}$ , IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see Figure 6-4 for timing diagram

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f_{(\text{PDMCLK})}$	PDMCLK clock frequency	0.768		6.144	MHz
$t_{H(\text{PDMCLK})}$	PDMCLK high pulse duration	72			ns
$t_{L(\text{PDMCLK})}$	PDMCLK low pulse duration	72			ns
$t_{r(\text{PDMCLK})}$	PDMCLK rise time			18	ns
$t_{f(\text{PDMCLK})}$	PDMCLK fall time			18	ns

## 7 Detailed Description

### 7.1 Overview

The PCM3140-Q1 is a high-performance, low-power, flexible, quad-channel, audio analog-to-digital converter (ADC) with extensive feature integration. This device is intended for applications in voice-activated systems, professional microphones, audio conferencing, portable computing, communication, and entertainment applications. The high dynamic range of the device enables far-field audio recording with high fidelity. This device integrates a host of features that reduces cost, board space, and power consumption in space-constrained, battery-powered, consumer, home, and industrial applications.

The PCM3140-Q1 consists of the following blocks:

- Quad-channel, multibit, high-performance delta-sigma ( $\Delta\Sigma$ ) ADC
- Configurable single-ended or differential audio inputs
- Low-noise, programmable microphone bias output
- Automatic gain controller (AGC)
- Programmable decimation filters with linear-phase or low-latency filter
- Programmable channel gain, volume control, biquad filters for each channel
- Programmable phase and gain calibration with fine resolution for each channel
- Programmable high-pass filter (HPF), and digital channel mixer
- Pulse density modulation (PDM) digital microphone interface with high-performance decimation filter
- Integrated low-jitter phase-locked loop (PLL) supporting a wide range of system clocks
- Integrated digital and analog voltage regulators to support single-supply operation

Communication to the PCM3140-Q1 to configure the control registers is supported using an I<sup>2</sup>C or SPI interface. The device supports a highly flexible audio serial interface [time-division multiplexing (TDM), I<sup>2</sup>S, or left-justified (LJ)] to transmit audio data seamlessly in the system across devices.

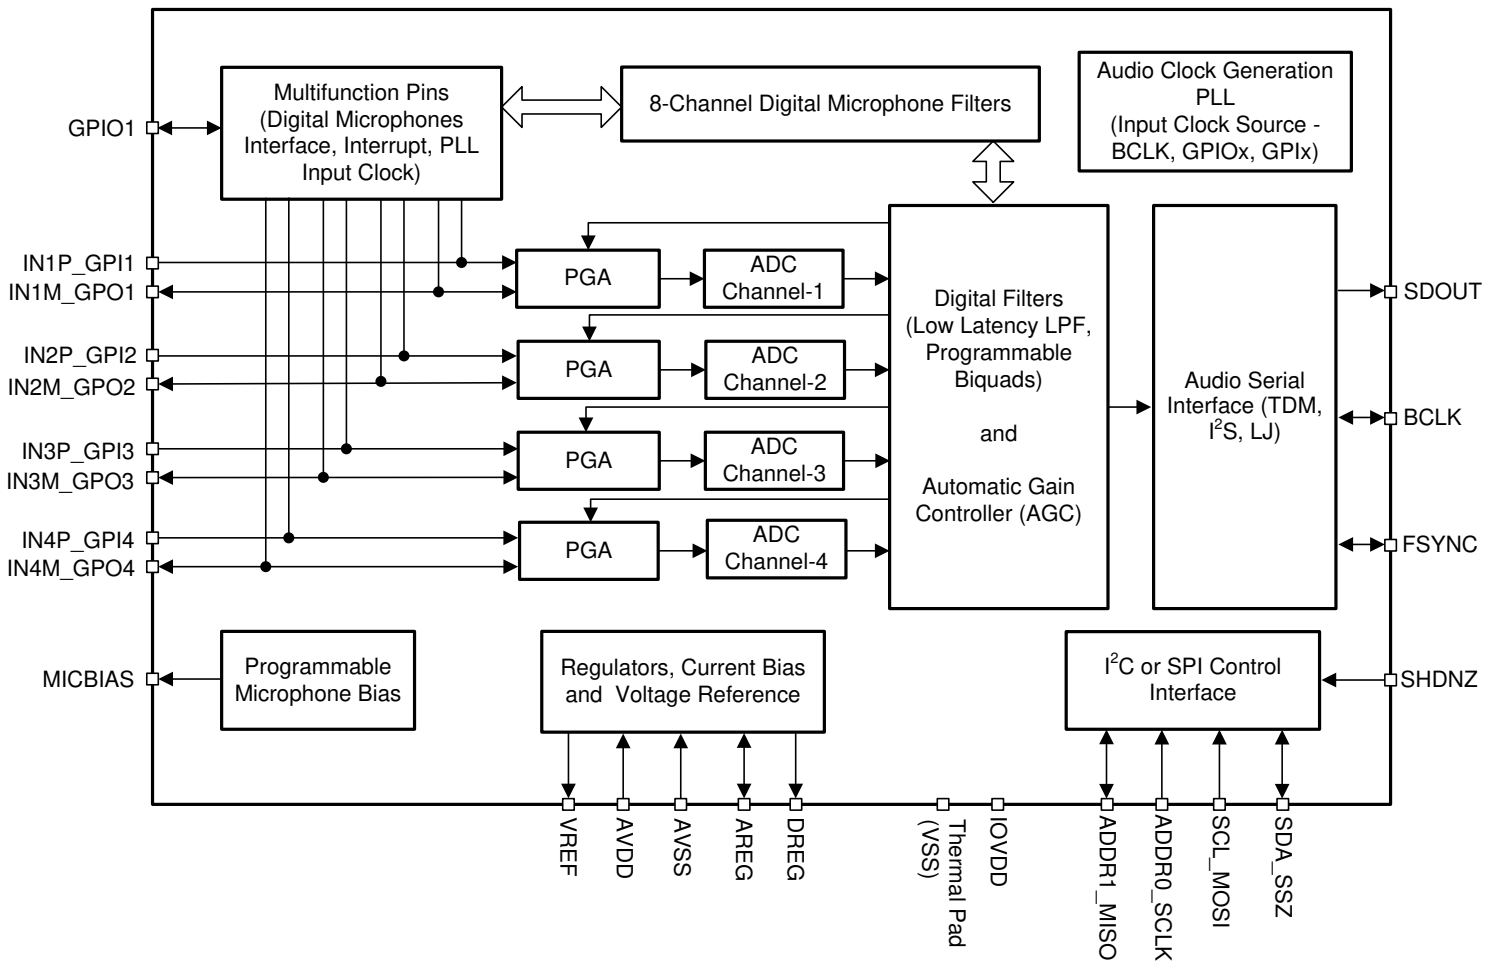

The device can support multiple devices by sharing the common I<sup>2</sup>C and TDM buses across devices. Moreover, the device includes a daisy-chain feature and a secondary audio serial output data pin. These features relax the shared TDM bus timing requirements and board design complexities when operating multiple devices for applications requiring high audio data bandwidth.

[Table 7-1](#) lists the reference abbreviations used throughout this document to registers that control the device.

**Table 7-1. Abbreviations for Register References**

REFERENCE	ABBREVIATION	DESCRIPTION	EXAMPLE
Page y, register z, bit k	Py_Rz_Dk	Single data bit. The value of a single bit in a register.	Page 4, register 36, bit 0 = P4_R36_D0
Page y, register z, bits k-m	Py_Rz_D[k:m]	Range of data bits. A range of data bits (inclusive).	Page 4, register 36, bits 3-0 = P4_R36_D[3:0]
Page y, register z	Py_Rz	One entire register. All eight bits in the register as a unit.	Page 4, register 36 = P4_R36
Page y, registers z-n	Py_Rz-Rn	Range of registers. A range of registers in the same page.	Page 4, registers 36, 37, 38 = P4_R36-R38

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Serial Interfaces

This device has two serial interfaces: control and audio data. The control serial interface is used for device configuration. The audio data serial interface is used for transmitting audio data to the host device.

#### 7.3.1.1 Control Serial Interfaces

The device contains configuration registers and programmable coefficients that can be set to the desired values for a specific system and application use. All these registers can be accessed using either I²C or SPI communication to the device. For more information, see the [Section 7.5](#) section.

#### 7.3.1.2 Audio Serial Interfaces

Digital audio data flows between the host processor and the PCM3140-Q1 on the digital audio serial interface (ASI), or audio bus. This highly flexible ASI bus includes a TDM mode for multichannel operation, support for I²S or left-justified protocols format, programmable data length options, very flexible controller-target configurability for bus clock lines and the ability to communicate with multiple devices within a system directly.

The bus protocol TDM, I<sup>2</sup>S, or left-justified (LJ) format can be selected by using the ASI\_FORMAT[1:0], P0\_R7\_D[7:6] register bits. As shown in [Table 7-2](#) and [Table 7-3](#), these modes are all most significant byte (MSB)-first, pulse code modulation (PCM) data format, with the output channel data word-length programmable as 16, 20, 24, or 32 bits by configuring the ASI\_WLEN[1:0], P0\_R7\_D[5:4] register bits.

**Table 7-2. Audio Serial Interface Format**

P0_R7_D[7:6] : ASI_FORMAT[1:0]	AUDIO SERIAL INTERFACE FORMAT
00 (default)	Time division multiplexing (TDM) mode
01	Inter IC sound (I <sup>2</sup> S) mode
10	Left-justified (LJ) mode
11	Reserved (do not use this setting)

**Table 7-3. Audio Output Channel Data Word-Length**

P0_R7_D[5:4] : ASI_WLEN[1:0]	AUDIO OUTPUT CHANNEL DATA WORD-LENGTH
00	Output channel data word-length set to 16 bits
01	Output channel data word-length set to 20 bits
10	Output channel data word-length set to 24 bits
11 (default)	Output channel data word-length set to 32 bits

The frame sync pin, FSYNC, is used in this audio bus protocol to define the beginning of a frame and has the same frequency as the output data sample rates. The bit clock pin, BCLK, is used to clock out the digital audio data across the serial bus. The number of bit-clock cycles in a frame must accommodate multiple device active output channels with the programmed data word length.

A frame consists of multiple time-division channel slots (up to 64) to allow all output channel audio data transmissions to complete on the audio bus by a device or multiple PCM3140-Q1 devices sharing the same audio bus. The device supports up to eight output channels that can be configured to place their audio data on bus slot 0 to slot 63. [Table 7-4](#) lists the output channel slot configuration settings. In I<sup>2</sup>S and LJ mode, the slots are divided into two sets, left-channel slots and right-channel slots, as described in the [Section 7.3.1.2.2](#) and [Section 7.3.1.2.3](#) sections.

**Table 7-4. Output Channel Slot Assignment Settings**

P0_R11_D[5:0] : CH1_SLOT[5:0]	OUTPUT CHANNEL 1 SLOT ASSIGNMENT
00 0000 = 0d (default)	Slot 0 for TDM or left slot 0 for I <sup>2</sup> S, LJ.
00 0001 = 1d	Slot 1 for TDM or left slot 1 for I <sup>2</sup> S, LJ.
...	...
01 1111 = 31d	Slot 31 for TDM or left slot 31 for I <sup>2</sup> S, LJ.
10 0000 = 32d	Slot 32 for TDM or right slot 0 for I <sup>2</sup> S, LJ.
...	...
11 1110 = 62d	Slot 62 for TDM or right slot 30 for I <sup>2</sup> S, LJ.
11 1111 = 63d	Slot 63 for TDM or right slot 31 for I <sup>2</sup> S, LJ.

Similarly, the slot assignment setting for output channel 2 to channel 8 can be done using the CH2\_SLOT (P0\_R12) to CH8\_SLOT (P0\_R18) registers, respectively.

The slot word length is the same as the output channel data word length set for the device. The output channel data word length must be set to the same value for all PCM3140-Q1 devices if all devices share the same ASI bus in a system. The maximum number of slots possible for the ASI bus in a system is limited by the available bus bandwidth, which depends upon the BCLK frequency, output data sample rate used, and the channel data word length configured.

The device also includes a feature that offsets the start of the slot data transfer with respect to the frame sync by up to 31 cycles of the bit clock. [Table 7-5](#) lists the programmable offset configuration settings.

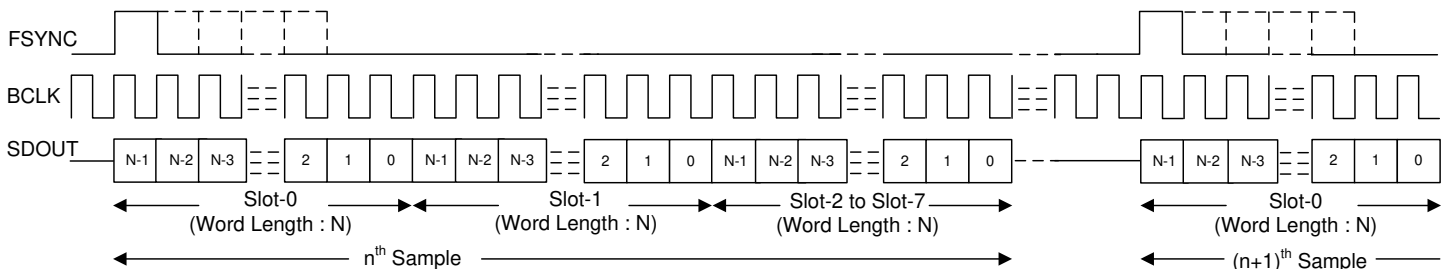

**Table 7-5. Programmable Offset Settings for the ASI Slot Start**

P0_R8_D[4:0] : TX_OFFSET[4:0]	PROGRAMMABLE OFFSET SETTING FOR SLOT DATA TRANSMISSION START
0 0000 = 0d (default)	The device follows the standard protocol timing without any offset.
0 0001 = 1d	Slot start is offset by one BCLK cycle, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by one BCLK cycle, as compared to standard protocol timing.
.....	.....
1 1110 = 30d	Slot start is offset by 30 BCLK cycles, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by 30 BCLK cycles, as compared to standard protocol timing.
1 1111 = 31d	Slot start is offset by 31 BCLK cycles, as compared to standard protocol timing. For I <sup>2</sup> S or LJ, the left and right slot start is offset by 31 BCLK cycles, as compared to standard protocol timing.

The device also features the ability to invert the polarity of the frame sync pin, FSYNC, used to transfer the audio data as compared to the default FSYNC polarity used in standard protocol timing. This feature can be set using the FSYNC\_POL, P0\_R7\_D3 register bit. Similarly, the device can invert the polarity of the bit clock pin, BCLK, which can be set using the BCLK\_POL, P0\_R7\_D2 register bit.

#### 7.3.1.2.1 Time Division Multiplexed Audio (TDM) Interface

In TDM mode, also known as DSP mode, the rising edge of FSYNC starts the data transfer with the slot 0 data first. Immediately after the slot 0 data transmission, the remaining slot data are transmitted in order. FSYNC and each data bit (except the MSB of slot 0 when TX\_OFFSET equals 0) is transmitted on the rising edge of BCLK. [Figure 7-1](#) to [Figure 7-4](#) illustrate the protocol timing for TDM operation with various configurations.

**Figure 7-1. TDM Mode Standard Protocol Timing (TX\_OFFSET = 0)**

**Figure 7-2. TDM Mode Protocol Timing (TX\_OFFSET = 2)**

**Figure 7-3. TDM Mode Protocol Timing (No Idle BCLK Cycles, TX\_OFFSET = 2)**

**Figure 7-4. TDM Mode Protocol Timing (TX\_OFFSET = 0 and BCLK\_POL = 1)**

For proper operation of the audio bus in TDM mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels times the programmed word length of the output channel data. The device supports FSYNC as a pulse with a 1-cycle-wide bit clock, but also supports multiples as well. For a higher BCLK frequency operation, using TDM mode with a TX\_OFFSET value higher than 0 is recommended.

#### 7.3.1.2.2 Inter IC Sound (I<sup>2</sup>S) Interface

The standard I<sup>2</sup>S protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In I<sup>2</sup>S mode, the MSB of the left slot 0 is transmitted on the falling edge of BCLK in the second cycle after the *falling* edge of FSYNC. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted on the falling edge of BCLK in the second cycle after the *rising* edge of FSYNC. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC and each data bit is transmitted on the falling edge of BCLK. [Figure 7-5](#) to [Figure 7-8](#) illustrate the protocol timing for I<sup>2</sup>S operation with various configurations.

**Figure 7-5. I<sup>2</sup>S Mode Standard Protocol Timing (TX\_OFFSET = 0)**

**Figure 7-6. I²S Protocol Timing (TX\_OFFSET = 1)**

**Figure 7-7. I²S Protocol Timing (No Idle BCLK Cycles, TX\_OFFSET = 0)**

**Figure 7-8. I²S Protocol Timing (TX\_OFFSET = 0 and BCLK\_POL = 1)**

For proper operation of the audio bus in I²S mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC low pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC high pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured.

### 7.3.1.2.3 Left-Justified (LJ) Interface

The standard LJ protocol is defined for only two channels: left and right. The device extends the same protocol timing for multichannel operation. In LJ mode, the MSB of the left slot 0 is transmitted in the same BCLK cycle after the *rising* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the left slot 0 data transmission, the remaining left slot data are transmitted in order. The MSB of the right slot 0 is transmitted in the same BCLK cycle after the *falling* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. Immediately after the right slot 0 data transmission, the remaining right slot data are transmitted in order. FSYNC is transmitted on the falling edge of BCLK. [Figure 7-9](#) to [Figure 7-12](#) illustrate the protocol timing for LJ operation with various configurations.

**Figure 7-9. LJ Mode Standard Protocol Timing (TX\_OFFSET = 0)**

**Figure 7-10. LJ Protocol Timing (TX\_OFFSET = 2)**

**Figure 7-11. LJ Protocol Timing (No Idle BCLK Cycles, TX\_OFFSET = 0)**

**Figure 7-12. LJ Protocol Timing (TX\_OFFSET = 1 and BCLK\_POL = 1)**

For proper operation of the audio bus in LJ mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the programmed word length of the output channel data. The device FSYNC high pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active left slots times the data word length configured. Similarly, the FSYNC low pulse must be number of BCLK cycles wide that is greater than or equal to the number of active right slots times the data word length configured. For a higher BCLK frequency operation, using LJ mode with a TX\_OFFSET value higher than 0 is recommended.

### 7.3.1.3 Using Multiple Devices With Shared Buses

The device has many supported features and flexible options that can be used in the system to seamlessly connect multiple PCM3140-Q1 devices by sharing a single common I<sup>2</sup>C control bus and an audio serial interface bus. This architecture enables multiple applications to be applied to a system that require a microphone array for beam-forming operation, audio conferencing, noise cancellation, and so forth. [Figure 7-13](#) shows a diagram of multiple PCM3140-Q1 devices in a configuration where the control and audio data buses are shared.

**Figure 7-13. Multiple PCM3140-Q1 Devices With Shared Control and Audio Data Buses**

The PCM3140-Q1 consists of the following features to enable seamless connection and interaction of multiple devices using a shared bus:

- Supports up to four pin-programmable I<sup>2</sup>C target addresses
- I<sup>2</sup>C broadcast simultaneously writes to (or triggers) all PCM3140-Q1 devices
- Supports up to 64 configuration output channel slots for the audio serial interface
- Tri-state feature (with enable and disable) for the unused audio data slots of the device
- Supports a bus-holder feature (with enable and disable) to keep the last driven value on the audio bus
- The GPIO1 or GPOx pin can be configured as a secondary output data lane for the audio serial interface
- The GPIO1 or GPIx pin can be used in a daisy-chain configuration of multiple PCM3140-Q1 devices
- Supports one BCLK cycle data latching timing to relax the timing requirement for the high-speed interface
- Programmable controller and target options for the audio serial interface
- Ability to synchronize the multiple devices for the simultaneous sampling requirement across devices

See the [Multiple TLV320ADCx140 Devices With a Shared TDM and I<sup>2</sup>C Bus application report](#) for further details.

### 7.3.2 Phase-Locked Loop (PLL) and Clock Generation

The device has a smart auto-configuration block to generate all necessary internal clocks required for the ADC modulator and the digital filter engine used for signal processing. This configuration is done by monitoring the frequency of the FSYNC and BCLK signal on the audio bus.

The device supports the various output data sample rates (of the FSYNC signal frequency) and the BCLK to FSYNC ratio to configure all clock dividers, including the PLL configuration, internally without host programming. [Table 7-6](#) and [Table 7-7](#) list the supported FSYNC and BCLK frequencies.

**Table 7-6. Supported FSYNC (Multiples or Submultiples of 48 kHz) and BCLK Frequencies**

BCLK TO FSYNC RATIO	BCLK (MHz)								
	FSYNC (8 kHz)	FSYNC (16 kHz)	FSYNC (24 kHz)	FSYNC (32 kHz)	FSYNC (48 kHz)	FSYNC (96 kHz)	FSYNC (192 kHz)	FSYNC (384 kHz)	FSYNC (768 kHz)
16	Reserved	0.256	0.384	0.512	0.768	1.536	3.072	6.144	12.288
24	Reserved	0.384	0.576	0.768	1.152	2.304	4.608	9.216	18.432
32	0.256	0.512	0.768	1.024	1.536	3.072	6.144	12.288	24.576
48	0.384	0.768	1.152	1.536	2.304	4.608	9.216	18.432	Reserved
64	0.512	1.024	1.536	2.048	3.072	6.144	12.288	24.576	Reserved
96	0.768	1.536	2.304	3.072	4.608	9.216	18.432	Reserved	Reserved
128	1.024	2.048	3.072	4.096	6.144	12.288	24.576	Reserved	Reserved
192	1.536	3.072	4.608	6.144	9.216	18.432	Reserved	Reserved	Reserved
256	2.048	4.096	6.144	8.192	12.288	24.576	Reserved	Reserved	Reserved
384	3.072	6.144	9.216	12.288	18.432	Reserved	Reserved	Reserved	Reserved
512	4.096	8.192	12.288	16.384	24.576	Reserved	Reserved	Reserved	Reserved
1024	8.192	16.384	24.576	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
2048	16.384	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

**Table 7-7. Supported FSYNC (Multiples or Submultiples of 44.1 kHz) and BCLK Frequencies**

BCLK TO FSYNC RATIO	BCLK (MHz)								
	FSYNC (7.35 kHz)	FSYNC (14.7 kHz)	FSYNC (22.05 kHz)	FSYNC (29.4 kHz)	FSYNC (44.1 kHz)	FSYNC (88.2 kHz)	FSYNC (176.4 kHz)	FSYNC (352.8 kHz)	FSYNC (705.6 kHz)
16	Reserved	Reserved	0.3528	0.4704	0.7056	1.4112	2.8224	5.6448	11.2896

192	1.4112	2.8224	4.2336	5.6448	8.4672	16.9344	Reserved	Reserved	Reserved
256	1.8816	3.7632	5.6448	7.5264	11.2896	22.5792	Reserved	Reserved	Reserved
384	2.8224	5.6448	8.4672	11.2896	16.9344	Reserved	Reserved	Reserved	Reserved
512	3.7632	7.5264	11.2896	15.0528	22.5792	Reserved	Reserved	Reserved	Reserved
1024	7.5264	15.0528	22.5792	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
2048	15.0528	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

The status register ASI\_STS, P0\_R21, captures the device auto detect result for the FSYNC frequency and the BCLK to FSYNC ratio. If the device finds any unsupported combinations of FSYNC frequency and BCLK to FSYNC ratios, the device generates an ASI clock-error interrupt and mutes the record channels accordingly.

The device uses an integrated, low-jitter, phase-locked loop (PLL) to generate internal clocks required for the ADC modulator and digital filter engine, as well as other control blocks. The device also supports an option

to use BCLK, GPIO1, or the GPIx pin (as MCLK) as the audio clock source without using the PLL to reduce power consumption. However, the ADC performance may degrade based on jitter from the external clock source, and some processing features may not be supported if the external audio clock source frequency is not high enough. Therefore, TI recommends using the PLL for high-performance applications. More details and information on how to configure and use the device in low-power mode without using the PLL are discussed in the [TLV320ADCx140 Operation for Low-Power Critical Applications application report](#).

The device also supports an audio bus controller mode operation using the GPIO1 or GPIx pin (as MCLK) as the reference input clock source and supports various flexible options and a wide variety of system clocks. More details and information on controller mode configuration and operation are discussed in the [Configuring and Operating the TLV320ADCx140 as an Audio Bus Master application report](#).

The audio bus clock error detection and auto-detect feature automatically generates all internal clocks, but can be disabled using the ASI\_ERR, P0\_R9\_D5 and AUTO\_CLK\_CFG, P0\_R19\_D6, register bits, respectively. In the system, this disable feature can be used to support custom clock frequencies that are not covered by the auto detect scheme. For such application use cases, care must be taken to ensure that the multiple clock dividers are all configured appropriately. Therefore, TI recommends using the PPC3 GUI for device configuration settings; for more details see the [TLV320ADCx140 Evaluation module user's guide](#) and the [PurePath™ console graphical development suite](#).

### 7.3.3 Input Channel Configurations

The device consists of four pairs of analog input pins (INxP and INxM) that can be configured as differential inputs or single-ended inputs for the recording channel. The device supports simultaneous recording of up to four channels using the high-performance multichannel ADC. The input source for the analog pins can be from electret condenser analog microphones, microelectrical-mechanical system (MEMS) analog microphones, or line-in (auxiliary) inputs from the system board. Additionally, if the application uses digital PDM microphones for the recording, then the INxP and INxM pins can be reconfigured in the device to support up to eight channels for the digital microphone recording. [Table 7-8](#) shows the input source selection for the record channel.

**Table 7-8. Input Source Selection for the Record Channel**

P0_R60_D[6:5] : CH1_INSRC[1:0]	INPUT CHANNEL 1 RECORD SOURCE SELECTION
00 (default)	Analog differential input for channel 1 (this setting is valid only when the GPI1 and GPO1 pin functions are disabled)
01	Analog single-ended Input for channel 1 (this setting is valid only when the GPI1 and GPO1 pin functions are disabled)
10	Digital PDM input for channel 1 (configure the GPIx and GPOx pin accordingly for PDMIN1 and PDMCLK)
11	Reserved (do not use this setting)

Similarly, the input source selection setting for input channel 2, channel 3, and channel 4 can be configured using the CH2\_INSRC[1:0] (P0\_R65\_D[6:5]), CH3\_INSRC[1:0] (P0\_R70\_D[6:5]), and CH4\_INSRC[1:0] (P0\_R75\_D[6:5]) register bits, respectively.

Typically, voice or audio signal inputs are capacitively coupled (AC-coupled) to the device; however, the device also supports an option for DC-coupled inputs to save board space. This configuration can be done independently for each channel by setting the CH1\_DC (P0\_R60\_D4), CH2\_DC (P0\_R65\_D4), CH3\_DC (P0\_R70\_D4), and CH4\_DC (P0\_R75\_D4) register bits. The INM pin can be directly grounded in DC-coupled mode (see [Figure 7-14](#)), but the INM pin must be grounded after the AC-coupling capacitor in AC-coupled mode (see [Figure 7-15](#)) for the single-ended input configuration. For the best dynamic range performance, the differential AC-coupled input must be used .

**Figure 7-14. Single-Ended DC-Coupled Input Connection**

**Figure 7-15. Single-Ended AC-Coupled Input Connection**

The device allows for flexibility in choosing the typical input impedance on INxP or INxM from 2.5 k $\Omega$  (default), 10 k $\Omega$ , and 20 k $\Omega$  based on the input source impedance. The higher input impedance results in slightly higher noise or lower dynamic range. Table 7-9 lists the configuration register settings for the input impedance for the record channel.

**Table 7-9. Input Impedance Selection for the Record Channel**

P0_R60_D[3:2] : CH1_IMP[1:0]	CHANNEL 1 INPUT IMPEDANCE SELECTION
00 (default)	Channel 1 input impedance typical value is 2.5 k $\Omega$ on INxP or INxM
01	Channel 1 input impedance typical value is 10 k $\Omega$ on INxP or INxM
10	Channel 1 input impedance typical value is 20 k $\Omega$ on INxP or INxM
11	Reserved (do not use this setting)

Similarly, the input impedance selection setting for input channel 2, channel 3, and channel 4 can be configured using the CH2\_IMP[1:0] (P0\_R65\_D[3:2]), CH3\_IMP[1:0] (P0\_R70\_D[3:2]), and CH4\_IMP[1:0] (P0\_R75\_D[3:2]) register bits, respectively.

The value of the coupling capacitor in AC-coupled mode must be chosen so that the high-pass filter formed by the coupling capacitor and the input impedance do not affect the signal content. Before proper recording can begin, this coupling capacitor must be charged up to the common-mode voltage at power-up. To enable quick charging, the device has modes to speed up the charging of the coupling capacitor. The default value of the quick-charge timing is set for a coupling capacitor up to 1  $\mu$ F. However, if a higher-value capacitor is used in the system, then the quick-charging timing can be increased by using the INCAP\_QCHG (P0\_R5\_D[5:4]) register bits. For best distortion performance, use the low-voltage coefficient capacitors for AC coupling. The input impedance value of 2.5 k $\Omega$  is not supported for the DC-coupled input.

### 7.3.4 Reference Voltage

All audio data converters require a DC reference voltage. The PCM3140-Q1 achieves low-noise performance by internally generating a low-noise reference voltage. This reference voltage is generated using a band-gap circuit with high PSRR performance. This audio converter reference voltage must be filtered externally using a minimum 1- $\mu$ F capacitor connected from the VREF pin to analog ground (AVSS).

The value of this reference voltage can be configured using the P0\_R59\_D[1:0] register bits and must be set to an appropriate value based on the desired full-scale input for the device and the AVDD supply voltage available in the system. The default VREF value is set to 2.75 V, which in turn supports a 2- $V_{RMS}$  differential full-scale input to the device. The required minimum AVDD voltage for this mode is 3 V. Table 7-10 lists the various VREF settings supported along with required AVDD range and the supported full-scale input signal for that configuration.

**Table 7-10. VREF Programmable Settings**

P0_R59_D[1:0] : ADC_FSCALE[1:0]	VREF OUTPUT VOLTAGE (Same as Internal ADC VREF)	DIFFERENTIAL FULL-SCALE INPUT SUPPORTED	SINGLE-ENDED FULL-SCALE INPUT SUPPORTED	AVDD RANGE REQUIREMENT
00 (default)	2.75 V	2 $V_{RMS}$	1 $V_{RMS}$	3 V to 3.6 V
01	2.5 V	1.818 $V_{RMS}$	0.909 $V_{RMS}$	2.8 V to 3.6 V

**Table 7-10. VREF Programmable Settings (continued)**

P0_R59_D[1:0] : ADC_FSCALE[1:0]	VREF OUTPUT VOLTAGE (Same as Internal ADC VREF)	DIFFERENTIAL FULL- SCALE INPUT SUPPORTED	SINGLE-ENDED FULL- SCALE INPUT SUPPORTED	AVDD RANGE REQUIREMENT
10	1.375 V	1 V <sub>RMS</sub>	0.5 V <sub>RMS</sub>	1.7 V to 1.9 V
11	Reserved	Reserved	Reserved	Reserved

To achieve low-power consumption, this audio reference block is powered down as described in the [Section 7.4.2](#) section. When exiting sleep mode, the audio reference block is powered up using the internal fast-charge scheme and the VREF pin settles to its steady-state voltage after the settling time (a function of the decoupling capacitor on the VREF pin). This time is approximately equal to 3.5 ms when using a 1-μF decoupling capacitor. If a higher-value decoupling capacitor is used on the VREF pin, the fast-charge setting must be reconfigured using the VREF\_QCHG, P0\_R2\_D[4:3] register bits, which support options of 3.5 ms (default), 10 ms, 50 ms, or 100 ms.

### 7.3.5 Programmable Microphone Bias

The device integrates a built-in, low-noise microphone bias pin that can be used in the system for biasing electret-condenser microphones or providing the supply to the MEMS analog or digital microphone. The integrated bias amplifier supports up to 20 mA of load current that can be used for multiple microphones and is designed to provide a combination of high PSRR, low noise, and programmable bias voltages to allow the biasing to be fine tuned for specific microphone combinations.

When using this MICBIAS pin for biasing or supplying to multiple microphones, avoid any common impedance on the board layout for the MICBIAS connection to minimize coupling across microphones. [Table 7-11](#) shows the available microphone bias programmable options.

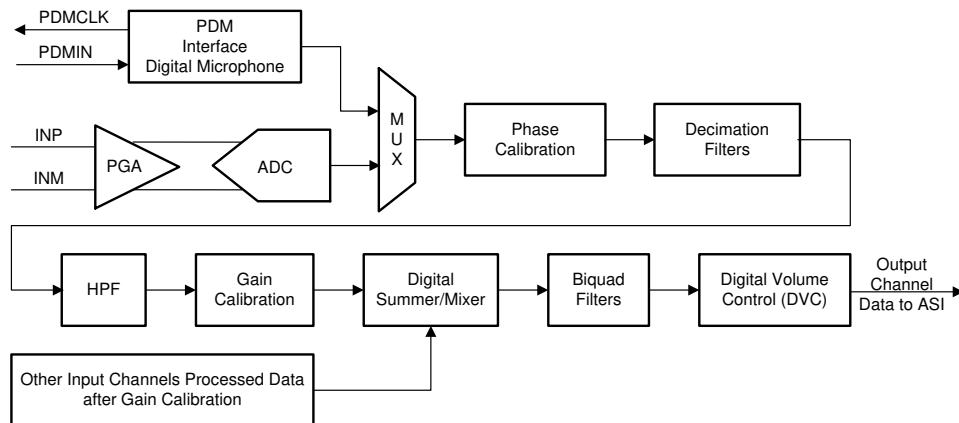

**Table 7-11. MICBIAS Programmable Settings**

P0_R59_D[6:4] : MBIAS_VAL[2:0]	P0_R59_D[1:0] : ADC_FSCALE[1:0]	MICBIAS OUTPUT VOLTAGE
000 (default)	00 (default)	2.75 V (same as the VREF output)
	01	2.5 V (same as the VREF output)
	10	1.375 V (same as the VREF output)
001	00 (default)	3.014 V (1.096 times the VREF output)
	01	2.740 V (1.096 times the VREF output)
	10	1.507 V (1.096 times the VREF output)
010 to 101	XX	Reserved (do not use these settings)
110	XX	Same as AVDD
111	XX	Reserved (do not use this setting)

The microphone bias output can be powered on or powered off (default) by configuring the MICBIAS\_PDZ, P0\_R117\_D7 register bit. Additionally, the device provides an option to configure the GPIO1 or GPIx pin to directly control the microphone bias output powering on or off. This feature is useful to control the microphone directly without engaging the host for I<sup>2</sup>C or SPI communication. The MICBIAS\_PDZ, P0\_R117\_D7 register bit value is ignored if the GPIO1 or GPIx pin is configured to set the microphone bias on or off.

### 7.3.6 Signal-Chain Processing

The PCM3140-Q1 signal chain is comprised of very-low-noise, high-performance, and low-power analog blocks and highly flexible and programmable digital processing blocks. The high performance and flexibility combined with a compact package makes the PCM3140-Q1 optimized for a variety of end-equipments and applications that require multichannel audio capture. Figure 7-16 shows a conceptual block diagram that highlights the various building blocks used in the signal chain, and how the blocks interact in the signal chain.

**Figure 7-16. Signal-Chain Processing Flowchart**

The front-end PGA is very low noise, with a 120-dB dynamic range performance. Along with a low-noise and low-distortion, multibit, delta-sigma ADC, the front-end PGA enables the PCM3140-Q1 to record a far-field audio signal with very high fidelity, both in quiet and loud environments. Moreover, the ADC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band during ADC sampling. Further on in the signal chain, an integrated, high-performance multistage digital decimation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The device also has an integrated programmable biquad filter that allows for custom low-pass, high-pass, or any other desired frequency shaping. Thus, the overall signal chain architecture removes the requirement to add external components for antialiasing low-pass filtering, and thus saves drastically on the external system component cost and board space. See the [TLV320ADCx140 Integrated Analog Antialiasing Filter and Flexible Digital Filter application report](#) for further details.

The signal chain also consists of various highly programmable digital processing blocks such as phase calibration, gain calibration, high-pass filter, digital summer or mixer, biquad filters, and volume control. The details on these processing blocks are discussed further in this section. The device also supports up to eight digital PDM microphone recording channels when the analog record channels are not used. Channels 1 to 4 in the signal chain block diagram of Figure 7-16 are as described in this section, however, channels 5 to 8 only support the digital microphone recording option and do not support the digital summer or mixer option.

The desired input channels for recording can be enabled or disabled by using the IN\_CH\_EN (P0\_R115) register, and the output channels for the audio serial interface can be enabled or disabled by using the ASI\_OUT\_EN (P0\_R116) register. In general, the device supports simultaneous power-up and power-down of all active channels for simultaneous recording. However, based on the application needs, if some channels must be powered-up or powered-down dynamically when the other channel recording is on, then that use case is supported by setting the DYN\_CH\_PUPD\_EN, P0\_R117\_D4 register bit to 1'b1 but do not power-down channel 1 in this mode of operation.

The device supports an input signal bandwidth up to 80 kHz, which allows the high-frequency non-audio signal to be recorded by using a 176.4-kHz (or higher) sample rate.

For output sample rates of 48 kHz or lower, the device supports all features for 8-channel recording and various programmable processing blocks. However, for output sample rates higher than 48 kHz, there are limitations in

the number of simultaneous channel recordings supported and the number of biquad filters and such. See the [TLV320ADCx140 Sampling Rates and Programmable Processing Blocks Supported application report](#) for further details.

### 7.3.6.1 Programmable Channel Gain and Digital Volume Control

The device has an independent programmable channel gain setting for each input channel that can be set to the appropriate value based on the maximum input signal expected in the system and the ADC VREF setting used (see the [Section 7.3.4](#) section), which determines the ADC full-scale signal level.

Configure the desired channel gain setting before powering up the ADC channel and do not change this setting while the ADC is powered on. The programmable range supported for each channel gain is from 0 dB to 42 dB in steps of 1 dB. To achieve low-noise performance, the device internal logic first maximizes the gain for the front-end low-noise analog PGA, which supports a dynamic range of 120 dB, and then applies any residual programmed channel gain in the digital processing block.

[Table 7-12](#) shows the programmable options available for the channel gain.

**Table 7-12. Channel Gain Programmable Settings**

P0_R61_D[7:2] : CH1_GAIN[5:0]	CHANNEL GAIN SETTING FOR INPUT CHANNEL 1
00 0000 = 0d (default)	Input channel 1 gain is set to 0 dB
00 0001 = 1d	Input channel 1 gain is set to 1 dB
00 0010 = 2d	Input channel 1 gain is set to 2 dB
...	...
10 1001 = 41d	Input channel 1 gain is set to 41 dB
10 1010 = 42d	Input channel 1 gain is set to 42 dB
10 1011 to 11 1111 = 43d to 63d	Reserved (do not use these settings)

Similarly, the channel gain setting for input channel 2, channel 3, and channel 4 can be configured using the CH2\_GAIN (P0\_R66), CH3\_GAIN (P0\_R71), and CH4\_GAIN (P0\_R76) register bits, respectively. The channel gain feature is not available for the digital microphone record path.

The device also has a programmable digital volume control with a range from –100 dB to 27 dB in steps of 0.5 dB with the option to mute the channel recording. The digital volume control value can be changed dynamically while the ADC channel is powered-up and recording. During volume control changes, the soft ramp-up or ramp-down volume feature is used internally to avoid any audible artifacts. Soft-stepping can be entirely disabled using the DISABLE\_SOFT\_STEP (P0\_R108\_D4) register bit.

The digital volume control setting is independently available for each output channel, including the digital microphone record channel. However, the device also supports an option to gang-up the volume control setting for all channels together using the channel 1 digital volume control setting, regardless if channel 1 is powered up or powered down. This gang-up can be enabled using the DVOL\_GANG (P0\_R108\_D7) register bit.

[Table 7-13](#) shows the programmable options available for the digital volume control.

**Table 7-13. Digital Volume Control (DVC) Programmable Settings**

P0_R62_D[7:0] : CH1_DVOL[7:0]	DVC SETTING FOR OUTPUT CHANNEL 1
0000 0000 = 0d	Output channel 1 DVC is set to mute
0000 0001 = 1d	Output channel 1 DVC is set to –100 dB
0000 0010 = 2d	Output channel 1 DVC is set to –99.5 dB
0000 0011 = 3d	Output channel 1 DVC is set to –99 dB
...	...
1100 1000 = 200d	Output channel 1 DVC is set to –0.5 dB
1100 1001 = 201d (default)	Output channel 1 DVC is set to 0 dB
1100 1010 = 202d	Output channel 1 DVC is set to 0.5 dB
...	...

**Table 7-13. Digital Volume Control (DVC) Programmable Settings (continued)**

P0_R62_D[7:0] : CH1_DVOL[7:0]	DVC SETTING FOR OUTPUT CHANNEL 1
1111 1101 = 253d	Output channel 1 DVC is set to 26 dB
1111 1110 = 254d	Output channel 1 DVC is set to 26.5 dB
1111 1111 = 255d	Output channel 1 DVC is set to 27 dB

Similarly, the digital volume control setting for output channel 2 to channel 8 can be configured using the CH2\_DVOL (P0\_R67) to CH8\_DVOL (P0\_R97) register bits, respectively.

The internal digital processing engine soft ramps up the volume from a muted level to the programmed volume level when the channel is powered up, and the internal digital processing engine soft ramps down the volume from a programmed volume to mute when the channel is powered down. This soft-stepping of volume is done to prevent abruptly powering up and powering down the record channel. This feature can also be entirely disabled using the DISABLE\_SOFT\_STEP (P0\_R108\_D4) register bit.

### 7.3.6.2 Programmable Channel Gain Calibration

Along with the programmable channel gain and digital volume, this device also provides programmable channel gain calibration. The gain of each channel can be finely calibrated or adjusted in steps of 0.1 dB for a range of –0.8-dB to 0.7-dB gain error. This adjustment is useful when trying to match the gain across channels resulting from external components and microphone sensitivity. This feature, in combination with the regular digital volume control, allows the gains across all channels to be matched for a wide gain error range with a resolution of 0.1 dB. [Table 7-14](#) shows the programmable options available for the channel gain calibration.

**Table 7-14. Channel Gain Calibration Programmable Settings**

P0_R63_D[7:4] : CH1_GCAL[3:0]	CHANNEL GAIN CALIBRATION SETTING FOR INPUT CHANNEL 1
0000 = 0d	Input channel 1 gain calibration is set to –0.8 dB
0001 = 1d	Input channel 1 gain calibration is set to –0.7 dB
...	...
1000 = 8d (default)	Input channel 1 gain calibration is set to 0 dB
...	...
1110 = 14d	Input channel 1 gain calibration is set to 0.6 dB
1111 = 15d	Input channel 1 gain calibration is set to 0.7 dB

Similarly, the channel gain calibration setting for input channel 2 to channel 8 can be configured using the CH2\_GCAL (P0\_R68) to CH8\_GCAL (P0\_R98) register bits, respectively.

### 7.3.6.3 Programmable Channel Phase Calibration

In addition to the gain calibration, the phase delay in each channel can be finely calibrated or adjusted in steps of one modulator clock cycle for a cycle range of 0 to 255 for the phase error. The modulator clock, the same clock used for ADC\_MOD\_CLK, is 6.144 MHz (the output data sample rate is multiples or submultiples of 48 kHz) or 5.6448 MHz (the output data sample rate is multiples or submultiples of 44.1 kHz) irrespective of the analog microphone or digital microphone use case. This feature is very useful for many applications that must match the phase with fine resolution between each channel, including any phase mismatch across channels resulting from external components or microphones. [Table 7-15](#) shows the available programmable options for channel phase calibration.

**Table 7-15. Channel Phase Calibration Programmable Settings**

P0_R64_D[7:0] : CH1_PCAL[7:0]	CHANNEL PHASE CALIBRATION SETTING FOR INPUT CHANNEL 1
0000 0000 = 0d (default)	Input channel 1 phase calibration with no delay
0000 0001 = 1d	Input channel 1 phase calibration delay is set to one cycle of the modulator clock
0000 0010 = 2d	Input channel 1 phase calibration delay is set to two cycles of the modulator clock
...	...
1111 1110 = 254d	Input channel 1 phase calibration delay is set to 254 cycles of the modulator clock

**Table 7-15. Channel Phase Calibration Programmable Settings (continued)**

P0_R64_D[7:0] : CH1_PCAL[7:0]	CHANNEL PHASE CALIBRATION SETTING FOR INPUT CHANNEL 1
1111 1111 = 255d	Input channel 1 phase calibration delay is set to 255 cycles of the modulator clock

Similarly, the channel phase calibration setting for input channel 2 to channel 8 can be configured using the CH2\_PCAL (P0\_R69) to CH8\_PCAL (P0\_R99) register bits, respectively.

The phase calibration feature must not be used when the analog input and PDM input are used together for simultaneous conversion.

#### 7.3.6.4 Programmable Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a programmable high-pass filter (HPF). The HPF is not a channel-independent filter setting but is globally applicable for all ADC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter, and is efficient enough to filter out possible DC components of the signal. Table 7-16 shows the predefined –3-dB cutoff frequencies available that can be set by using the HPF\_SEL[1:0] register bits of P0\_R107. Additionally, to achieve a custom –3-dB cutoff frequency for a specific application, the device also allows the first-order IIR filter coefficients to be programmed when the HPF\_SEL[1:0] register bits are set to 2'b00. Figure 7-17 illustrates a frequency response plot for the HPF filter.

**Table 7-16. HPF Programmable Settings**

P0_R107_D[1:0] : HPF_SEL[1:0]	-3-dB CUTOFF FREQUENCY SETTING	-3-dB CUTOFF FREQUENCY AT 16-kHz SAMPLE RATE	-3-dB CUTOFF FREQUENCY AT 48-kHz SAMPLE RATE
00	Programmable 1st-order IIR filter	Programmable 1st-order IIR filter	Programmable 1st-order IIR filter
01 (default)	$0.00025 \times f_s$	4 Hz	12 Hz
10	$0.002 \times f_s$	32 Hz	96 Hz
11	$0.008 \times f_s$	128 Hz	384 Hz

**Figure 7-17. HPF Filter Frequency Response Plot**

Equation 1 gives the transfer function for the first-order programmable IIR filter:

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{31} - D_1 z^{-1}} \quad (1)$$

The frequency response for this first-order programmable IIR filter with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the IIR coefficients

in [Table 7-17](#) to achieve the desired frequency response for high-pass filtering or any other desired filtering. If HPF\_SEL[1:0] are set to 2'b00, the host device must write these coefficients values for the desired frequency response before powering-up any ADC channel for recording. These programmable coefficients are 32-bit, two's complement numbers. [Table 7-17](#) shows the filter coefficients for the first-order IIR filter.

**Table 7-17. 1st-Order IIR Filter Coefficients**

FILTER	FILTER COEFFICIENT	DEFAULT COEFFICIENT VALUE	COEFFICIENT REGISTER MAPPING
Programmable 1st-order IIR filter (can be allocated to HPF or any other desired filter)	N <sub>0</sub>	0x7FFFFFFF	P4_R72-R75
	N <sub>1</sub>	0x00000000	P4_R76-R79
	D <sub>1</sub>	0x00000000	P4_R80-R83

### 7.3.6.5 Programmable Digital Biquad Filters

The device supports up to 12 programmable digital biquad filters. These highly efficient filters achieve the desired frequency response. In digital signal processing, a digital biquad filter is a second-order, recursive linear filter with two poles and two zeros. [Equation 2](#) gives the transfer function of each biquad filter:

$$H(z) = \frac{N_0 + 2N_1z^{-1} + N_2z^{-2}}{2^{31} - 2D_1z^{-1} - D_2z^{-2}} \quad (2)$$

The frequency response for the biquad filter section with default coefficients is flat at a gain of 0 dB (all-pass filter). The host device can override the frequency response by programming the biquad coefficients to achieve the desired frequency response for a low-pass, high-pass, or any other desired frequency shaping. The programmable coefficients for the mixer operation are located in the [Section 8.2.1](#) and [Section 8.2.2](#) sections. If biquad filtering is required, then the host device must write these coefficients values before powering up any ADC channels for recording. These programmable coefficients are 32-bit, two's complement numbers. As described in [Table 7-18](#), these biquad filters can be allocated for each output channel based on the BIQUAD\_CFG[1:0] register setting of P0\_R108. By setting BIQUAD\_CFG[1:0] to 2'b00, the biquad filtering for all record channels is disabled and the host device can choose this setting if no additional filtering is required for the system application. See the [TLV320ADCx140 Programmable Biquad Filter Configuration and Applications application report](#) for further details.

**Table 7-18. Biquad Filter Allocation to the Record Output Channel**

PROGRAMMABLE BIQUAD FILTER	RECORD OUTPUT CHANNEL ALLOCATION USING P0_R108_D[6:5] REGISTER SETTING		
	BIQUAD_CFG[1:0] = 2'b01 (1 Biquad per Channel)	BIQUAD_CFG[1:0] = 2'b10 (Default) (2 Biquads per Channel)	BIQUAD_CFG[1:0] = 2'b11 (3 Biquads per Channel)
	SUPPORTS ALL 8 CHANNELS	SUPPORTS UP TO 6 CHANNELS	SUPPORTS UP TO 4 CHANNELS
Biquad filter 1	Allocated to output channel 1	Allocated to output channel 1	Allocated to output channel 1
Biquad filter 2	Allocated to output channel 2	Allocated to output channel 2	Allocated to output channel 2
Biquad filter 3	Allocated to output channel 3	Allocated to output channel 3	Allocated to output channel 3
Biquad filter 4	Allocated to output channel 4	Allocated to output channel 4	Allocated to output channel 4
Biquad filter 5	Not used	Allocated to output channel 1	Allocated to output channel 1
Biquad filter 6	Not used	Allocated to output channel 2	Allocated to output channel 2
Biquad filter 7	Not used	Allocated to output channel 3	Allocated to output channel 3
Biquad filter 8	Not used	Allocated to output channel 4	Allocated to output channel 4
Biquad filter 9	Allocated to output channel 5	Allocated to output channel 5	Allocated to output channel 1
Biquad filter 10	Allocated to output channel 6	Allocated to output channel 6	Allocated to output channel 2
Biquad filter 11	Allocated to output channel 7	Allocated to output channel 5	Allocated to output channel 3
Biquad filter 12	Allocated to output channel 8	Allocated to output channel 6	Allocated to output channel 4

Table 7-19 shows the biquad filter coefficients mapping to the register space.

**Table 7-19. Biquad Filter Coefficients Register Mapping**

PROGRAMMABLE BIQUAD FILTER	BIQUAD FILTER COEFFICIENTS REGISTER MAPPING	PROGRAMMABLE BIQUAD FILTER	BIQUAD FILTER COEFFICIENTS REGISTER MAPPING
Biquad filter 1	P2_R8-R27	Biquad filter 7	P3_R8-R27
Biquad filter 2	P2_R28-R47	Biquad filter 8	P3_R28-R47
Biquad filter 3	P2_R48-R67	Biquad filter 9	P3_R48-R67
Biquad filter 4	P2_R68-R87	Biquad filter 10	P3_R68-R87
Biquad filter 5	P2_R88-R107	Biquad filter 11	P3_R88-R107
Biquad filter 6	P2_R108-R127	Biquad filter 12	P3_R108-R127

### 7.3.6.6 Programmable Channel Summer and Digital Mixer

For applications that require an even higher SNR than that supported for each channel, the device digital summing mode can be used. In this mode, the digital record data are summed up across the channel with an equal weightage factor, which helps in reducing the effective record noise. Table 7-20 lists the configuration settings available for channel summing mode.

**Table 7-20. Channel Summing Mode Programmable Settings**

P0_R107_D[3:2] : CH_SUM[1:0]	CHANNEL SUMMING MODE FOR INPUT CHANNELS	SNR AND DYNAMIC RANGE BOOST
00 (Default)	Channel summing mode is disabled	Not applicable
01	Output channel 1 = (input channel 1 + input channel 2) / 2	Around 3-dB boost in SNR and dynamic range
	Output channel 2 = (input channel 1 + input channel 2) / 2	
	Output channel 3 = (input channel 3 + input channel 4) / 2	
	Output channel 4 = (input channel 3 + input channel 4) / 2	
	Output channel 5 = (input channel 5 + input channel 6) / 2	
	Output channel 6 = (input channel 5 + input channel 6) / 2	
10	Output channel 1 = (input channel 1 + input channel 2 + input channel 3 + input channel 4) / 4	Around 6-dB boost in SNR and dynamic range
	Output channel 2 = (input channel 1 + input channel 2 + input channel 3 + input channel 4) / 4	
	Output channel 3 = (input channel 1 + input channel 2 + input channel 3 + input channel 4) / 4	
	Output channel 4 = (input channel 1 + input channel 2 + input channel 3 + input channel 4) / 4	
11	Reserved (do not use this setting)	Not applicable

The device additionally supports a fully programmable mixer feature that can mix the various input channels with their custom programmable scale factor to generate the final output channels. The programmable mixer feature is available only if CH\_SUM[1:0] is set to 2'b00. The mixer function is only supported for input channel 1 to channel 4. Figure 7-18 shows a block diagram that describes the mixer 1 operation to generate output channel 1. The programmable coefficients for the mixer operation are located in the Section 8.2.3 section.

**Figure 7-18. Programmable Digital Mixer Block Diagram**

A similar mixer operation is performed by mixer 2, mixer 3, and mixer 4 to generate output channel 2, channel 3, and channel 4, respectively.

### 7.3.6.7 Configurable Digital Decimation Filters

The device record channel includes a high dynamic range, built-in digital decimation filter to process the oversampled data from the multibit delta-sigma ( $\Delta\Sigma$ ) modulator to generate digital data at the same Nyquist sampling rate as the FSYNC rate. As illustrated in [Figure 7-16](#), this decimation filter can also be used for processing the oversampled PDM stream from the digital microphone. The decimation filter can be chosen from three different types, depending on the required frequency response, group delay, and phase linearity requirements for the target application. The selection of the decimation filter option can be done by configuring the DECI\_FILT, P0\_R107\_D[5:4] register bits. [Table 7-21](#) shows the configuration register setting for the decimation filter mode selection for the record channel.

**Table 7-21. Decimation Filter Mode Selection for the Record Channel**

P0_R107_D[5:4] : DECI_FILT[1:0]	DECIMATION FILTER MODE SELECTION
00 (default)	Linear phase filters are used for the decimation
01	Low latency filters are used for the decimation
10	Ultra-low latency filters are used for the decimation
11	Reserved (do not use this setting)

#### 7.3.6.7.1 Linear Phase Filters

The linear phase decimation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

##### 7.3.6.7.1.1 Sampling Rate: 8 kHz or 7.35 kHz

[Figure 7-19](#) and [Figure 7-20](#) respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 8 kHz or 7.35 kHz. [Table 7-22](#) lists the specifications for a decimation filter with an 8-kHz or 7.35-kHz sampling rate.

**Figure 7-19. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-20. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-22. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	72.7			dB
	Frequency range is $4 \times f_s$ onwards	81.2			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		17.1		$1/f_s$

### 7.3.6.7.1.2 Sampling Rate: 16 kHz or 14.7 kHz

Figure 7-21 and Figure 7-22 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. Table 7-23 lists the specifications for a decimation filter with an 16-kHz or 14.7-kHz sampling rate.

**Figure 7-21. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-22. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-23. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.3			dB
	Frequency range is $4 \times f_s$ onwards	95.0			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		15.7		$1/f_s$

### 7.3.6.7.1.3 Sampling Rate: 24 kHz or 22.05 kHz

Figure 7-23 and Figure 7-24 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 24 kHz or 22.05 kHz. Table 7-24 lists the specifications for a decimation filter with an 24-kHz or 22.05-kHz sampling rate.

**Figure 7-23. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-24. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-24. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.0			dB
	Frequency range is $4 \times f_s$ onwards	96.4			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		16.6		$1/f_s$

#### 7.3.6.7.1.4 Sampling Rate: 32 kHz or 29.4 kHz

Figure 7-25 and Figure 7-26 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 32 kHz or 29.4 kHz. Table 7-25 lists the specifications for a decimation filter with an 32-kHz or 29.4-kHz sampling rate.

**Figure 7-25. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-26. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-25. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.7			dB
	Frequency range is $4 \times f_s$ onwards	107.2			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		16.9		$1/f_s$

#### 7.3.6.7.1.5 Sampling Rate: 48 kHz or 44.1 kHz

Figure 7-27 and Figure 7-28 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 48 kHz or 44.1 kHz. Table 7-26 lists the specifications for a decimation filter with an 48-kHz or 44.1-kHz sampling rate.

**Figure 7-27. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-28. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-26. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.8			dB
	Frequency range is $4 \times f_s$ onwards	98.1			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		17.1		$1/f_s$

### 7.3.6.7.1.6 Sampling Rate: 96 kHz or 88.2 kHz

Figure 7-29 and Figure 7-30 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 96 kHz or 88.2 kHz. Table 7-27 lists the specifications for a decimation filter with an 96-kHz or 88.2-kHz sampling rate.

**Figure 7-29. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-30. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-27. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.6			dB
	Frequency range is $4 \times f_s$ onwards	97.9			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		17.1		$1/f_s$

### 7.3.6.7.1.7 Sampling Rate: 192 kHz or 176.4 kHz

Figure 7-31 and Figure 7-32 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 192 kHz or 176.4 kHz. Table 7-28 lists the specifications for a decimation filter with an 192-kHz or 176.4-kHz sampling rate.

**Figure 7-31. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-32. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-28. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.3 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.473 \times f_s$ to $4 \times f_s$	70.0			dB
	Frequency range is $4 \times f_s$ onwards	111.0			
Group delay or latency	Frequency range is 0 to $0.3 \times f_s$		11.9		$1/f_s$

### 7.3.6.7.1.8 Sampling Rate: 384 kHz or 352.8 kHz

Figure 7-33 and Figure 7-34 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 384 kHz or 352.8 kHz. Table 7-29 lists the specifications for a decimation filter with an 384-kHz or 352.8-kHz sampling rate.

**Figure 7-33. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-34. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-29. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.212 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	70.0			dB
	Frequency range is $4 \times f_s$ onwards	108.8			
Group delay or latency	Frequency range is 0 to $0.212 \times f_s$		7.2		$1/f_s$

### 7.3.6.7.1.9 Sampling Rate 768 kHz or 705.6 kHz

Figure 7-35 and Figure 7-36 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 768 kHz or 705.6 kHz. Table 7-30 lists the specifications for a decimation filter with an 768-kHz or 705.6-kHz sampling rate.

**Figure 7-35. Linear Phase Decimation Filter Magnitude Response**

**Figure 7-36. Linear Phase Decimation Filter Pass-Band Ripple**

**Table 7-30. Linear Phase Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.113 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $2 \times f_s$	75.0			dB
	Frequency range is $2 \times f_s$ onwards	88.0			
Group Delay or Latency	Frequency range is 0 to $0.113 \times f_s$		5.9		$1/f_s$

### 7.3.6.7.2 Low-Latency Filters

For applications where low latency with minimal phase deviation (within the audio band) is critical, the low-latency decimation filters on the PCM3140-Q1 can be used. The device supports these filters with a group delay of approximately seven samples with an almost linear phase response within the  $0.365 \times f_s$  frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the low-latency filters.

#### 7.3.6.7.2.1 Sampling Rate: 16 kHz or 14.7 kHz

Figure 7-37 shows the magnitude response and Figure 7-38 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. Table 7-31 lists the specifications for a decimation filter with a 16-kHz or 14.7-kHz sampling rate.

**Table 7-31. Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.451 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.61 \times f_s$ onwards	87.3			dB
Group delay or latency	Frequency range is 0 to $0.363 \times f_s$		7.6		$1/f_s$
Group delay deviation	Frequency range is 0 to $0.363 \times f_s$	-0.022		0.022	$1/f_s$
Phase deviation	Frequency range is 0 to $0.363 \times f_s$	-0.21		0.25	Degrees

### 7.3.6.7.2.2 Sampling Rate: 24 kHz or 22.05 kHz

Figure 7-39 shows the magnitude response and Figure 7-40 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 24 kHz or 22.05 kHz. Table 7-32 lists the specifications for a decimation filter with a 24-kHz or 22.05-kHz sampling rate.

**Table 7-32. Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.459 \times f_s$	-0.01		0.01	dB
Stop-band attenuation	Frequency range is $0.6 \times f_s$ onwards	87.2			dB
Group delay or latency	Frequency range is 0 to $0.365 \times f_s$		7.5		$1/f_s$
Group delay deviation	Frequency range is 0 to $0.365 \times f_s$	-0.026		0.026	$1/f_s$
Phase deviation	Frequency range is 0 to $0.365 \times f_s$	-0.26		0.30	Degrees

### 7.3.6.7.2.3 Sampling Rate: 32 kHz or 29.4 kHz

Figure 7-41 shows the magnitude response and Figure 7-42 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 32 kHz or 29.4 kHz. Table 7-33 lists the specifications for a decimation filter with a 32-kHz or 29.4-kHz sampling rate.

**Table 7-33. Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.457 \times f_S$	-0.04		0.04	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	88.3			dB
Group delay or latency	Frequency range is 0 to $0.368 \times f_S$		8.7		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.368 \times f_S$	-0.026		0.026	$1/f_S$
Phase deviation	Frequency range is 0 to $0.368 \times f_S$	-0.26		0.31	Degrees

**7.3.6.7.2.4 Sampling Rate: 48 kHz or 44.1 kHz**

Figure 7-43 shows the magnitude response and Figure 7-44 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 48 kHz or 44.1 kHz. Table 7-34 lists the specifications for a decimation filter with a 48-kHz or 44.1-kHz sampling rate.

**Figure 7-43. Low-Latency Decimation Filter Magnitude Response****Figure 7-44. Low-Latency Decimation Filter Pass-Band Ripple and Phase Deviation****Table 7-34. Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.452 \times f_S$	-0.015		0.015	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	86.4			dB
Group delay or latency	Frequency range is 0 to $0.365 \times f_S$		7.7		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.365 \times f_S$	-0.027		0.027	$1/f_S$
Phase deviation	Frequency range is 0 to $0.365 \times f_S$	-0.25		0.30	Degrees

### 7.3.6.7.2.5 Sampling Rate: 96 kHz or 88.2 kHz

Figure 7-45 shows the magnitude response and Figure 7-46 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 96 kHz or 88.2 kHz. Table 7-35 lists the specifications for a decimation filter with a 96-kHz or 88.2-kHz sampling rate.

**Table 7-35. Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.466 \times f_s$	-0.04		0.04	dB
Stop-band attenuation	Frequency range is $0.6 \times f_s$ onwards	86.3			dB
Group delay or latency	Frequency range is 0 to $0.365 \times f_s$		7.7		$1/f_s$
Group delay deviation	Frequency range is 0 to $0.365 \times f_s$	-0.027		0.027	$1/f_s$
Phase deviation	Frequency range is 0 to $0.365 \times f_s$	-0.26		0.30	Degrees

### 7.3.6.7.2.6 Sampling Rate 192 kHz or 176.4 kHz

Figure 7-47 shows the magnitude response and Figure 7-48 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 192 kHz or 176.4 kHz. Table 7-36 lists the specifications for a decimation filter with a 192-kHz or 176.4-kHz sampling rate.

**Table 7-36. Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $463 \times f_S$	-0.03		0.03	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	85.6			dB
Group delay or latency	Frequency range is 0 to $0.365 \times f_S$		7.7		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.365 \times f_S$	-0.027		0.027	$1/f_S$
Phase deviation	Frequency range is 0 to $0.365 \times f_S$	-0.26		0.30	Degrees

### 7.3.6.7.3 Ultra-Low-Latency Filters

For applications where ultra-low latency (within the audio band) is critical, the ultra-low-latency decimation filters on the PCM3140-Q1 can be used. The device supports these filters with a group delay of approximately four samples with an almost linear phase response within the  $0.325 \times f_S$  frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the ultra-low-latency filters.

#### 7.3.6.7.3.1 Sampling Rate: 16 kHz or 14.7 kHz

Figure 7-49 shows the magnitude response and Figure 7-50 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. Table 7-37 lists the specifications for a decimation filter with a 16-kHz or 14.7-kHz sampling rate.

**Table 7-37. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.45 \times f_S$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	87.2			dB
Group delay or latency	Frequency range is 0 to $0.325 \times f_S$		4.3		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.325 \times f_S$	-0.512		0.512	$1/f_S$
Phase deviation	Frequency range is 0 to $0.325 \times f_S$	-10.0		14.2	Degrees

### 7.3.6.7.3.2 Sampling Rate: 24 kHz or 22.05 kHz

Figure 7-51 shows the magnitude response and Figure 7-52 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 24 kHz or 22.05 kHz. Table 7-38 lists the specifications for a decimation filter with a 24-kHz or 22.05-kHz sampling rate.

**Table 7-38. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.46 \times f_s$	-0.01		0.01	dB
Stop-band attenuation	Frequency range is $0.6 \times f_s$ onwards	87.1			dB
Group delay or latency	Frequency range is 0 to $0.325 \times f_s$		4.1		$1/f_s$
Group delay deviation	Frequency range is 0 to $0.325 \times f_s$	-0.514		0.514	$1/f_s$
Phase deviation	Frequency range is 0 to $0.325 \times f_s$	-10.0		14.3	Degrees

### 7.3.6.7.3.3 Sampling Rate: 32 kHz or 29.4 kHz

Figure 7-53 shows the magnitude response and Figure 7-54 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 32 kHz or 29.4 kHz. Table 7-39 lists the specifications for a decimation filter with an 32-kHz or 29.4-kHz sampling rate.

**Table 7-39. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.457 \times f_S$	-0.04		0.04	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	88.3			dB
Group delay or latency	Frequency range is 0 to $0.325 \times f_S$		5.2		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.325 \times f_S$	-0.492		0.492	$1/f_S$
Phase deviation	Frequency range is 0 to $0.325 \times f_S$	-9.5		13.5	Degrees

**7.3.6.7.3.4 Sampling Rate: 48 kHz or 44.1 kHz**

Figure 7-55 shows the magnitude response and Figure 7-56 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 48 kHz or 44.1 kHz. Table 7-40 lists the specifications for a decimation filter with a 48-kHz or 44.1-kHz sampling rate.

**Figure 7-55. Ultra-Low-Latency Decimation Filter Magnitude Response****Figure 7-56. Ultra-Low-Latency Decimation Filter Pass-Band Ripple and Phase Deviation****Table 7-40. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.452 \times f_S$	-0.015		0.015	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	86.4			dB
Group delay or latency	Frequency range is 0 to $0.325 \times f_S$		4.1		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.325 \times f_S$	-0.525		0.525	$1/f_S$
Phase deviation	Frequency range is 0 to $0.325 \times f_S$	-10.3		14.5	Degrees

### 7.3.6.7.3.5 Sampling Rate: 96 kHz or 88.2 kHz

Figure 7-57 shows the magnitude response and Figure 7-58 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 96 kHz or 88.2 kHz. Table 7-41 lists the specifications for a decimation filter with a 96-kHz or 88.2-kHz sampling rate.

**Table 7-41. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.466 \times f_s$	-0.04		0.04	dB
Stop-band attenuation	Frequency range is $0.6 \times f_s$ onwards	86.3			dB
Group delay or latency	Frequency range is 0 to $0.1625 \times f_s$		3.7		$1/f_s$
Group delay deviation	Frequency range is 0 to $0.1625 \times f_s$	-0.091		0.091	$1/f_s$
Phase deviation	Frequency range is 0 to $0.1625 \times f_s$	-0.86		1.30	Degrees

### 7.3.6.7.3.6 Sampling Rate 192 kHz or 176.4 kHz

Figure 7-59 shows the magnitude response and Figure 7-60 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 192 kHz or 176.4 kHz. Table 7-42 lists the specifications for a decimation filter with a 192-kHz or 176.4-kHz sampling rate.

**Table 7-42. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.463 \times f_S$	-0.03		0.03	dB
Stop-band attenuation	Frequency range is $0.6 \times f_S$ onwards	85.6			dB
Group delay or latency	Frequency range is 0 to $0.085 \times f_S$		3.7		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.085 \times f_S$	-0.024		0.024	$1/f_S$
Phase deviation	Frequency range is 0 to $0.085 \times f_S$	-0.12		0.18	Degrees

**7.3.6.7.3.7 Sampling Rate 384 kHz or 352.8 kHz**

Figure 7-61 shows the magnitude response and Figure 7-62 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 384 kHz or 352.8 kHz. Table 7-43 lists the specifications for a decimation filter with a 384-kHz or 352.8-kHz sampling rate.

**Table 7-43. Ultra-Low-Latency Decimation Filter Specifications**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.1 \times f_S$	-0.04		0.01	dB
Stop-band attenuation	Frequency range is $0.56 \times f_S$ onwards	70.1			dB
Group delay or latency	Frequency range is 0 to $0.157 \times f_S$		4.1		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.157 \times f_S$	-0.18		0.18	$1/f_S$
Phase deviation	Frequency range is 0 to $0.157 \times f_S$	-0.85		2.07	Degrees

### 7.3.7 Automatic Gain Controller (AGC)

The device includes an automatic gain controller (AGC) for ADC recording. As shown in [Figure 7-63](#), the AGC can be used to maintain a nominally constant output level when recording speech. Instead of manually setting the channel gain in AGC mode, the circuitry automatically adjusts the channel gain when the input signal becomes overly loud or very weak, such as when a person speaking into a microphone moves closer to or farther from the microphone. The AGC algorithm has several programmable parameters, including target level, maximum gain allowed, attack and release (or decay) time constants, and noise thresholds that allow the algorithm to be fine-tuned for any particular application.

**Figure 7-63. AGC Characteristics**

The target level (AGC\_LVL) represents the nominal approximate output level at which the AGC attempts to hold the ADC output signal level. The PCM3140-Q1 allows programming of different target levels, which can be programmed from –6 dB to –36 dB relative to a full-scale signal, and the AGC\_LVL default value is set to –34 dB. The target level is recommended to be set with enough margin to prevent clipping when loud sounds occur. [Table 7-44](#) lists the AGC target level configuration settings.

**Table 7-44. AGC Target Level Programmable Settings**

P0_R112_D[7:4] : AGC_LVL[3:0]	AGC TARGET LEVEL FOR OUTPUT
0000	The AGC target level is the –6-dB output signal level
0001	The AGC target level is the –8-dB output signal level
0010	The AGC target level is the –10-dB output signal level
...	...
1110 (default)	The AGC target level is the –34-dB output signal level
1111	The AGC target level is the –36-dB output signal level

The maximum gain allowed (AGC\_MAXGAIN) gives flexibility to the designer to restrict the maximum gain applied by the AGC. This feature limits the channel gain in situations where environmental noise is greater than the programmed noise threshold. The AGC\_MAXGAIN can be programmed from 3 dB to 42 dB with steps of 3 dB and the default value is set to 24 dB. [Table 7-45](#) lists the AGC\_MAXGAIN configuration settings.

**Table 7-45. AGC Maximum Gain Programmable Settings**

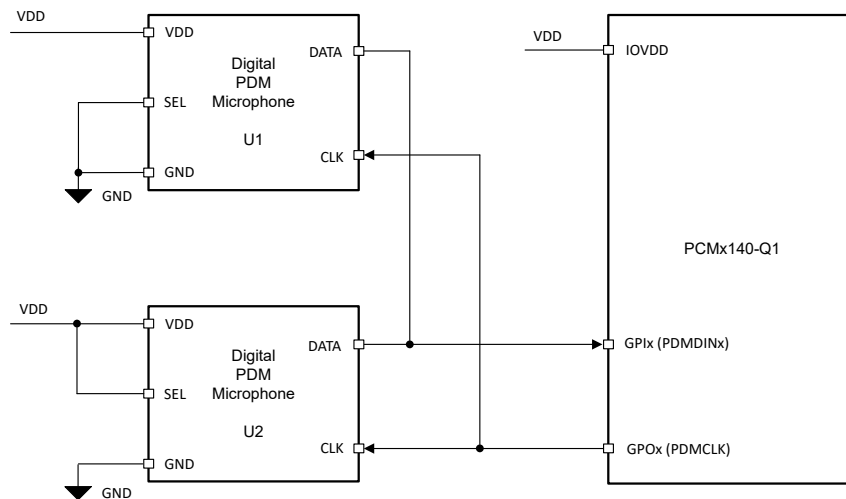

P0_R112_D[3:0] : AGC_MAXGAIN[3:0]	AGC MAXIMUM GAIN ALLOWED
0000	The AGC maximum gain allowed is 3 dB
0001	The AGC maximum gain allowed is 6 dB
0010	The AGC maximum gain allowed is 9 dB
...	...
0111 (default)	The AGC maximum gain allowed is 24 dB
...	...
1110	The AGC maximum gain allowed is 39 dB
1111	The AGC maximum gain allowed is 42 dB

For further details on the AGC various configurable parameter and application use, see the [Using the Automatic Gain Controller \(AGC\) in TLV320ADCx140 application report](#).

### 7.3.8 Digital PDM Microphone Record Channel

In addition to supporting analog microphones, the device also interfaces to digital pulse-density-modulation (PDM) microphones and uses high-order and high-performance decimation filters to generate pulse code modulation (PCM) output data that can be transmitted on the audio serial interface to the host. If analog microphones are not used in the system, then the analog input pins (INxP and INxM) can be repurposed as the GP1x and GPOx pins respectively and can be configured for the PDMCLK and PDMCLK clocks for digital PDM microphone recording. The device supports up to eight digital microphone recording channels.

The device internally generates PCMCLK with a programmable frequency of either 6.144 MHz, 3.072 MHz, 1.536 MHz, or 768 kHz (for output data sample rates in multiples or submultiples of 48 kHz) or 5.6448 MHz, 2.8224 MHz, 1.4112 MHz, or 705.6 kHz (for output data sample rates in multiples or submultiples of 44.1 kHz) using the PDMCLK\_DIV[1:0], P0\_R31\_D[1:0] register bits. PDMCLK can be routed on the GPOx pin. This clock can be connected to the external digital microphone device. Figure 7-64 shows a connection diagram of the digital PDM microphones.

**Figure 7-64. Digital PDM Microphones Connection Diagram to the PCM3140-Q1**

The single-bit output of the external digital microphone device can be connected to the GP1x pin. This single data line can be shared by two digital microphones to place their data on the opposite edge of PDMCLK. Internally, the device latches the steady value of the data on the rising edge of PDMCLK or the falling edge of PDMCLK based on the configuration register bits set in P0\_R32\_D[7:4]. Figure 7-65 shows the digital PDM microphone interface timing diagram.

**Figure 7-65. Digital PDM Microphone Protocol Timing Diagram**

When the digital microphone is used for recording, the analog blocks of the respective ADC channel are powered down and bypassed for power efficiency. Use the CH1\_INSRC[1:0] (P0\_R60\_D[6:5]), CH2\_INSRC[1:0] (P0\_R65\_D[6:5]), CH3\_INSRC[1:0] (P0\_R70\_D[6:5]), and CH4\_INSRC[1:0] (P0\_R75\_D[6:5]) register bits to select the analog microphone or digital microphone for channel 1 to channel 4.

### 7.3.9 Interrupts, Status, and Digital I/O Pin Multiplexing

Certain events in the device may require host processor intervention and can be used to trigger interrupts to the host processor. One such event is an audio serial interface (ASI) bus error. The device powers down the record channels if any faults are detected with the ASI bus error clocks, such as:

- Invalid FSYNC frequency
- Invalid SBCLK to FSYNC ratio
- Long pauses of the SBCLK or FSYNC clocks

When an ASI bus clock error is detected, the device shuts down the record channel as quickly as possible. After all ASI bus clock errors are resolved, the device volume ramps back to its previous state to recover the record channel. During an ASI bus clock error, the internal interrupt request (IRQ) interrupt signal asserts low if the clock error interrupt mask register bit INT\_MASK0[7], P0\_R51\_D7 is set low. The clock fault is also available for readback in the latched fault status register bit INT\_LTCH0, P0\_R54, which is a read-only register. Reading the latched fault status register, INT\_LTCH0, clears all latched fault status. The device can be additionally configured to route the internal IRQ interrupt signal on the GPIO1 or GPOx pins and also can be configured as open-drain outputs so that these pins can be wire-ANDed to the open-drain interrupt outputs of other devices.

The IRQ interrupt signal can either be configured as active low or active high polarity by setting the INT\_POL, P0\_R50\_D7 register bit. This signal can also be configured as a single pulse or a series of pulses by programming the INT\_EVENT[1:0], P0\_R50\_D[6:5] register bits. If the interrupts are configured as a series of pulses, the events trigger the start of pulses that stop when the latched fault status register is read to determine the cause of the interrupt.

The device also supports read-only live-status registers to determine if the channels are powered up or down and if the device is in sleep mode or not. These status registers are located in P0\_R118, DEV\_STS0 and P0\_R119, DEV\_STS1.

The device has a multifunctional GPIO1 pin that can be configured for a desired specific function. Additionally, if the channel is not used for analog input recording, then the analog input pins for that channel (INxP and INxM) can be repurposed as multifunction pins (GPIx and GPOx) by configuring the CHx\_INSRC[1:0] register bits located in the CHx\_CFG0 register. The maximum number of GPO pins supported by the device is four and the maximum number of GPI pins are four. [Table 7-46](#) shows all possible allocations of these multifunctional pins for the various features.

**Table 7-46. Multifunction Pin Assignments**

ROW	Pin Function <sup>(4)</sup>	GPIO1	GPO1	GPO2	GPO3	GPO4	GPI1	GPI2	GPI3	GPI4
—	—	GPIO1_CFG	GPO1_CFG	GPO2_CFG	GPO3_CFG	GPO4_CFG	GPI1_CFG	GPI2_CFG	GPI3_CFG	GPI4_CFG
—	—	P0_R33[7:4]	P0_R34[7:4]	P0_R35[7:4]	P0_R36[7:4]	P0_R37[7:4]	P0_R43[6:4]	P0_R43[2:0]	P0_R44[6:4]	P0_R44[2:0]
A	Pin disabled	S <sup>(1)</sup>	S (default)	S (default)	S (default)	S (default)	S (default)	S (default)	S (default)	S (default)
B	General-purpose output (GPO)	S	S	S	S	S	NS <sup>(2)</sup>	NS	NS	NS
C	Interrupt output (IRQ)	S (default)	S	S	S	S	NS	NS	NS	NS
D	Secondary ASI output (SDOUT2) <sup>(3)</sup>	S	S	S	S	S	NS	NS	NS	NS
E	PDM clock output (PDMCLK)	S	S	S	S	S	NS	NS	NS	NS
F	MICBIAS on/off input (BIASEN)	S	NS	NS	NS	NS	NS	NS	NS	NS
G	General-purpose input (GPI)	S	NS	NS	NS	NS	S	S	S	S
H	Master clock input (MCLK)	S	NS	NS	NS	NS	S	S	S	S
I	ASI daisy-chain input (SDIN)	S	NS	NS	NS	NS	S	S	S	S
J	PDM data input 1 (PDMIN1)	S	NS	NS	NS	NS	S	S	S	S
K	PDM data input 2 (PDMIN2)	S	NS	NS	NS	NS	S	S	S	S
L	PDM data input 3 (PDMIN3)	S	NS	NS	NS	NS	S	S	S	S
M	PDM data input 4 (PDMIN4)	S	NS	NS	NS	NS	S	S	S	S

(1) S means the feature mentioned in this row is *supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.

- (2) NS means the feature mentioned in this row is *not supported* for the respective GPIO1, GPOx, or GPIx pin mentioned in this column.
- (3) For the high-speed ASI output, GPIO1 must be used instead of GPOx for the secondary ASI output. GPOx can be used only if the bus speed requirement is less than 6.144 MHz.
- (4) Only the GPIO1 pin is with reference to the IOVDD supply, the other GPOx and GPIx pins are with reference to the AVDD supply and their primary pin functions are for the PDMCLK or PDMDIN function.

The GPIO1 drive strength can be configured with the GPIO1\_DRV[2:0](P0\_R33) register bits. [GPIO1 Drive Configuration Settings](#) lists the drive configuration settings available. Similarly, the GPOx pins can be configured using the GPOx\_DRV[0] (P0\_R33-37) bit. However only Hi-Z and Active High/Active Low drive options are available. [GPOx Drive Configuration Settings](#) shows the configuration options for GPO1. The same options are available in GPO2, 3, and 4.

**Table 7-47. GPIO1 Drive Configuration Settings**

P0_R33_D[2:0] : GPIO1_DRV[2:0]	GPIO OUTPUT DRIVE CONFIGURATION SETTINGS FOR GPIO1
000	The GPIO1 pin is set to high impedance (floated)
001	The GPIO1 pin is set to be driven active low or active high
010 (default)	The GPIO1 pin is set to be driven active low or weak high (on-chip pullup)
011	The GPIO1 pin is set to be driven active low or Hi-Z (floated)
100	The GPIO1 pin is set to be driven weak low (on-chip pulldown) or active high
101	The GPIO1 pin is set to be driven Hi-Z (floated) or active high
110 and 111	Reserved (do not use these settings)

**Table 7-48. GPOx Drive Configuration Settings**

P0_R34_D[0] : GPO1_DRV[0]	GPO1 OUTPUT DRIVE CONFIGURATION SETTINGS FOR GPO1
000	The GPO1 pin is set to high impedance (floated)
001	The GPO1 pin is set to be driven active low or active high

When configured as a general-purpose output (GPO), the GPIO1 or GPOx pin values can be driven by writing the GPIO\_VAL or GPOx\_VAL, P0\_R41 registers. The GPIO\_MON, P0\_R42 register can be used to readback the status of the GPIO1 pin when configured as a general-purpose input (GPI). Similarly, the GPI\_MON, P0\_R47 register can be used to readback the status of the GPIx pins when configured as a general-purpose input (GPI).

## 7.4 Device Functional Modes

### 7.4.1 Hardware Shutdown

The device enters hardware shutdown mode when the SHDNZ pin is asserted low or the AVDD supply voltage is not applied to the device. In hardware shutdown mode, the device consumes the minimum quiescent current from the AVDD supply. All configuration registers and programmable coefficients lose their value in this mode, and I<sup>2</sup>C or SPI communication to the device is not supported.

If the SHDNZ pin is asserted low when the device is in active mode, the device ramps down volume on the record data, powers down the analog and digital blocks, and puts the device into hardware shutdown mode in 25 ms (typical). The device can also be immediately put into hardware shutdown mode from active mode if the SHDNZ\_CFG[1:0], P0\_R5\_D[3:2], register bits are set to 2'b00. After the SHDNZ pin is asserted low, and after the device enters hardware shutdown mode, keep the SHDNZ pin low for at least 1 ms before releasing SHDNZ for further device operation.

Assert the SHDNZ pin high only when the IOVDD supply settles to a steady voltage level. When the SHDNZ pin goes high, the device sets all configuration registers and programmable coefficients to their default values, and then enters sleep mode.

### 7.4.2 Sleep Mode or Software Shutdown

In sleep mode or software shutdown mode, the device consumes very low quiescent current from the AVDD supply and, at the same time, allows the I<sup>2</sup>C or SPI communication to wake the device for active operation.

The device can also enter sleep mode when the host device sets the SLEEP\_ENZ, P0\_R2\_D0 bit to 1'b0. If the SLEEP\_ENZ bit is asserted low when the device is in active mode, the device ramps down the volume on the record data, powers down the analog and digital blocks, and enters sleep mode. However, the device still continues to retain the last programmed value of the device configuration registers and programmable coefficients.

In sleep mode, do not perform any I<sup>2</sup>C or SPI transactions, except for exiting sleep mode in order to enter active mode. After entering sleep mode, wait at least 10 ms before starting I<sup>2</sup>C or SPI transactions to exit sleep mode.

While exiting sleep mode, the host device must configure the PCM3140-Q1 to use either an external 1.8-V AREG supply (default setting) or an on-chip-regulator-generated AREG supply. To configure the AREG supply, write to AREG\_SELECT, bit D7 in the same P0\_R2 register.

### 7.4.3 Active Mode

If the host device exits sleep mode by setting the SLEEP\_ENZ bit to 1'b1, the device enters active mode. In active mode, I<sup>2</sup>C or SPI transactions can be done to configure and power-up the device for active operation. After entering active mode, wait at least 1 ms before starting any I<sup>2</sup>C or SPI transactions in order to allow the device to complete the internal wake-up sequence.

After configuring all other registers for the target application and system settings, configure the input and output channel enable registers, P0\_R115 (IN\_CH\_EN) and P0\_R116 (ASI\_OUT\_CH\_EN), respectively. Lastly, configure the device power-up register, P0\_R117 (PWR\_CFG). All the programmable coefficient values must be written before powering up the respective channel.

In active mode, the power-up and power-down status of various blocks is monitored by reading the read-only device status bits located in the P0\_R117 (DEV\_STS0) and P0\_R118 (DEV\_STS1) registers.

### 7.4.4 Software Reset

A software reset can be done any time by asserting the SW\_RESET bit, P0\_R1\_D0, which is a self-clearing bit. This software reset immediately shuts down the device, and restores all device configuration registers and programmable coefficients to their default values.

## 7.5 Programming

The device contains configuration registers and programmable coefficients that can be set to the desired values for a specific system and application use. These registers are called *device control registers* and are each eight bits in width, mapped using a page scheme.

Each page contains 128 configuration registers. All device configuration registers are stored in page 0, which is the default page setting at power up and after a software reset. All programmable coefficient registers are located in page 2, page 3, and page 4. The current page of the device can be switched to a new desired page by using the PAGE[7:0] bits located in register 0 of every page.

### 7.5.1 Control Serial Interfaces

The device control registers can be accessed using either I<sup>2</sup>C or SPI communication to the device.

By monitoring the SDA\_SSZ, SCL\_MOSI, ADDR0\_SCLK, and ADDR1\_MISO device pins, which are the multiplexed pins for the I<sup>2</sup>C or SPI Interface, the device automatically detects whether the host device is using I<sup>2</sup>C or SPI communication to configure the device. For a given end application, the host device must always use either the I<sup>2</sup>C or SPI interface, but not both, to configure the device.

#### 7.5.1.1 I<sup>2</sup>C Control Interface

The device supports the I<sup>2</sup>C control protocol as a target device, and is capable of operating in standard mode, fast mode, and fast mode plus. The I<sup>2</sup>C control protocol requires a 7-bit target address. The five most significant bits (MSBs) of the target address are fixed at 10011 and cannot be changed. The two least significant bits (LSBs) are programmable and are controlled by the ADDR0\_SCLK and ADDR1\_MISO pins. These two pins must always be either pulled to VSS or IOVDD. If the I2C\_BRDCAST\_EN (P0\_R2\_D2) bit is set to 1'b1, then the I<sup>2</sup>C target address is fixed to 1001100 in order to allow simultaneous I<sup>2</sup>C broadcast communication to all PCM3140-Q1 devices in the system. [Table 7-49](#) lists the four possible device addresses resulting from this configuration.

**Table 7-49. I<sup>2</sup>C Target Address Settings**

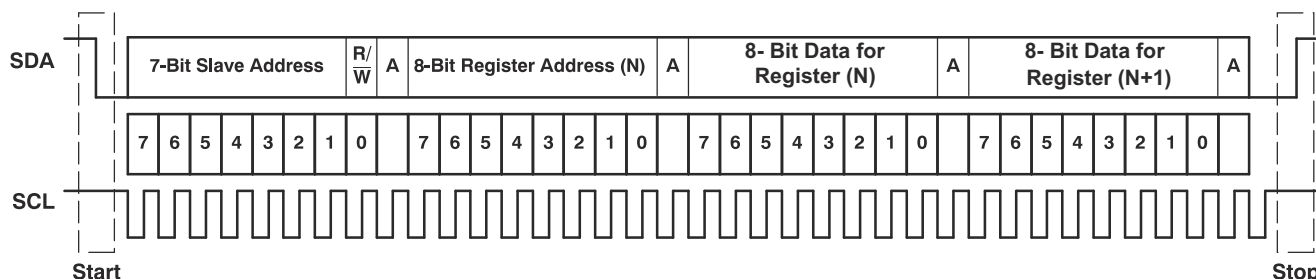

ADDR1_MISO	ADDR0_SCLK	I2C_BRDCAST_EN (P0_R2_D2)	I <sup>2</sup> C TARGET ADDRESS
0	0	0 (default)	1001 100
0	1	0 (default)	1001 101
1	0	0 (default)	1001 110
1	1	0 (default)	1001 111
X	X	1	1001 100

##### 7.5.1.1.1 General I<sup>2</sup>C Operation

The I<sup>2</sup>C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system using serial data transmission. The address and data 8-bit bytes are transferred MSB first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the controller device driving a start condition on the bus and ends with the controller device driving a stop condition on the bus. The bus uses transitions on the data pin (SDA) while the clock is at logic high to indicate start and stop conditions. A high-to-low transition on SDA indicates a start, and a low-to-high transition indicates a stop. Normal data-bit transitions must occur within the low time of the clock period.

The controller device drives a start condition followed by the 7-bit target address and the read/write (R/W) bit to open communication with another device and then waits for an acknowledgment condition. The target device holds SDA low during the acknowledge clock period to indicate acknowledgment. When this occurs, the controller device transmits the next byte of the sequence. Each target device is addressed by a unique 7-bit target address plus the R/W bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection.

There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the controller device generates a stop condition to release the bus. Figure 7-66 shows a generic data transfer sequence.

**Figure 7-66. Typical I<sup>2</sup>C Sequence**

In the system, use external pullup resistors for the SDA and SCL signals to set the logic high level for the bus. The SDA and SCL voltages must not exceed the device supply voltage, IOVDD.

#### 7.5.1.1.2 I<sup>2</sup>C Single-Byte and Multiple-Byte Transfers

The device I<sup>2</sup>C interface supports both single-byte and multiple-byte read/write operations for all registers. During multiple-byte read operations, the device responds with data, a byte at a time, starting at the register assigned, as long as the controller device continues to respond with acknowledges.

The device supports sequential I<sup>2</sup>C addressing. For write transactions, if a register is issued followed by data for that register and all the remaining registers that follow, a sequential I<sup>2</sup>C write transaction takes place. For I<sup>2</sup>C sequential write transactions, the register issued then serves as the starting point, and the amount of data subsequently transmitted, before a stop or start is transmitted, determines how many registers are written.

##### 7.5.1.1.2.1 I<sup>2</sup>C Single-Byte Write

As shown in Figure 7-67, a single-byte data write transfer begins with the controller device transmitting a start condition followed by the I<sup>2</sup>C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write-data transfer, the read/write bit must be set to 0. After receiving the correct I<sup>2</sup>C target address and the read/write bit, the device responds with an acknowledge bit (ACK). Next, the controller device transmits the register byte corresponding to the device internal register address being accessed. After receiving the register byte, the device again responds with an acknowledge bit (ACK). Then, the controller device transmits the byte of data to be written to the specified register. When finished, the target device responds with an acknowledge bit (ACK). Finally, the controller device transmits a stop condition to complete the single-byte data write transfer.

**Figure 7-67. I<sup>2</sup>C Single-Byte Write Transfer**

#### 7.5.1.1.2.2 I<sup>2</sup>C Multiple-Byte Write

As shown in Figure 7-68, a multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the controller device to the target device. After receiving each data byte, the device responds with an acknowledge bit (ACK). Finally, the controller device transmits a stop condition after the last data-byte write transfer.

**Figure 7-68. I<sup>2</sup>C Multiple-Byte Write Transfer**

#### 7.5.1.1.2.3 I<sup>2</sup>C Single-Byte Read

As shown in Figure 7-69, a single-byte data read transfer begins with the controller device transmitting a start condition followed by the I<sup>2</sup>C target address and the read/write bit. For the data read transfer, both a write followed by a read are done. Initially, a write is done to transfer the address byte of the internal register address to be read. As a result, the read/write bit is set to 0.

After receiving the target address and the read/write bit, the device responds with an acknowledge bit (ACK). The controller device then sends the internal register address byte, after which the device issues an acknowledge bit (ACK). The controller device transmits another start condition followed by the target address and the read/write bit again. This time, the read/write bit is set to 1, indicating a read transfer. Next, the device transmits the data byte from the register address being read. After receiving the data byte, the controller device transmits a not-acknowledge (NACK) followed by a stop condition to complete the single-byte data read transfer.

**Figure 7-69. I<sup>2</sup>C Single-Byte Read Transfer**

#### 7.5.1.1.2.4 I<sup>2</sup>C Multiple-Byte Read

As shown in Figure 7-70, a multiple-byte data read transfer is identical to a single-byte data read transfer except that multiple data bytes are transmitted by the device to the controller device. With the exception of the last data byte, the controller device responds with an acknowledge bit after receiving each data byte. After receiving the last data byte, the controller device transmits a not-acknowledge (NACK) followed by a stop condition to complete the data read transfer.

**Figure 7-70. I<sup>2</sup>C Multiple-Byte Read Transfer**

### 7.5.1.2 SPI Control Interface

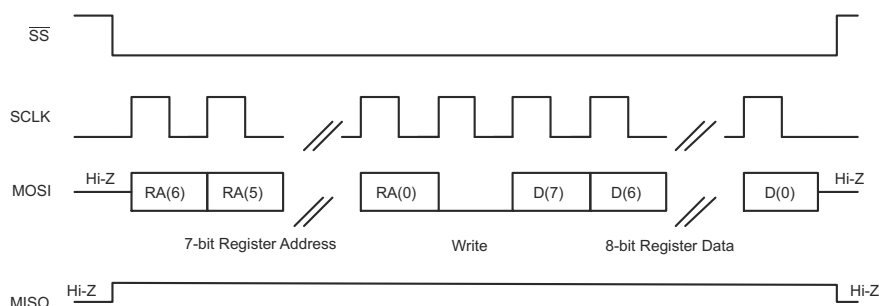

The general SPI protocol allows full-duplex, synchronous, serial communication between a host processor (the controller) and peripheral devices (targets). The SPI controller (in this case, the host processor) generates the synchronizing clock (driven onto SCLK) and initiates transmissions by taking the target-select pin SSZ from high to low. The SPI target devices (such as the PCM3140-Q1) depend on a controller to start and synchronize transmissions. A transmission begins when initiated by an SPI controller. The byte from the SPI controller begins shifting in on the target MOSI pin under the control of the controller serial clock (driven onto SCLK). When the byte shifts in on the MOSI pin, a byte shifts out on the MISO pin to the controller shift register.

The PCM3140-Q1 supports a standard SPI control protocol with a clock polarity setting of 0 (typical microprocessor SPI control bit CPOL = 0) and a clock phase setting of 1 (typical microprocessor SPI control bit CPHA = 1). The SSZ pin can remain low between transmissions; however, the device only interprets the first eight bits transmitted after the falling edge of SSZ as a command byte, and the next eight bits as a data byte only if writing to a register. The device is entirely controlled by registers. Reading and writing these registers is accomplished by an 8-bit command sent to the MOSI pin prior to the data for that register. [Table 7-50](#) shows the command structure. The first seven bits specify the address of the register that is being written or read, from 0 to 127 (decimal). The command word ends with an R/W bit, which specifies the direction of data flow on the serial bus.

In the case of a register write, set the R/W bit to 0. A second byte of data is sent to the MOSI pin and contains the data to be written to the register. A register read is accomplished in a similar fashion. The 8-bit command word sends the 7-bit register address, followed by the R/W bit equal to 1 to signify a register read. The 8-bit register data is then clocked out of the device on the MISO pin during the second eight SCLK clocks in the frame. The device supports sequential SPI addressing for a multiple-byte data write/read transfer until the SSZ pin is pulled high. A multiple-byte data write or read transfer is identical to a single-byte data write or read transfer, respectively, until all data byte transfers complete. The host device must keep the SSZ pin low during all data byte transfers. [Figure 7-71](#) shows the single-byte write transfer and [Figure 7-72](#) shows the single-byte read transfer.

**Table 7-50. SPI Command Word**

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
ADDR(6)	ADDR(5)	ADDR(4)	ADDR(3)	ADDR(2)	ADDR(1)	ADDR(0)	R/WZ

**Figure 7-71. SPI Single-Byte Write Transfer**

**Figure 7-72. SPI Single-Byte Read Transfer**

## 8 Register Maps

This section describes the control registers for the device in detail. All these registers are eight bits in width and allocated to device configuration and programmable coefficients settings. These registers are mapped internally using a page scheme that can be controlled using either I<sup>2</sup>C or SPI communication to the device. Each page contains 128 bytes of registers. All device configuration registers are stored in page 0, which is the default page setting at power up (and after a software reset). All programmable coefficient registers are located in page 2, page 3, and page 4. The device current page can be switch to a new desired page by using the PAGE[7:0] bits located in register 0 of every page.

Do not read from or write to reserved pages or reserved registers. Write only default values for the reserved bits in the valid registers.

The procedure for register access across pages is:

- Select page N (write data *N* to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page N
- Select the new page M (write data *M* to register 0 regardless of the current page number)
- Read or write data from or to valid registers in page M
- Repeat as needed

### 8.1 Device Configuration Registers

This section describes the device configuration registers for page 0.

**Table 8-1. Register Summary Table, Page = 0x00**

ADDRESS	REGISTER	DESCRIPTION	SECTION
0x00	PAGE_CFG	Device page register	<a href="#">PAGE_CFG Register (P0_R0)</a>

Table 8-2 lists the access codes used for the PCM3140-Q1 registers.

**Table 8-2. PCM3140-Q1 Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-W	R/W	Read or write
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

### 8.1.1 Register Descriptions

#### 8.1.1.1 PAGE\_CFG Register (page = 0x00, address = 0x00) [reset = 0h]

The device memory map is divided into pages. This register sets the page.

**Figure 8-1. PAGE\_CFG Register**

7	6	5	4	3	2	1	0
PAGE[7:0]							
R/W-0h							

**Table 8-3. PAGE\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	PAGE[7:0]	R/W	0h	These bits set the device page. 0d = Page 0 1d = Page 1 ... 255d = Page 255

### 8.1.1.2 SW\_RESET Register (page = 0x00, address = 0x01) [reset = 0h]

This register is the software reset register. Asserting a software reset places all register values in their default power-on-reset (POR) state.

**Figure 8-2. SW\_RESET Register**

7	6	5	4	3	2	1	0
Reserved							SW_RESET
R-0h							R/W-0h

**Table 8-4. SW\_RESET Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	Reserved	R	0h	Reserved
0	SW_RESET	R/W	0h	Software reset. This bit is self clearing. 0d = Do not reset 1d = Reset

### 8.1.1.3 SLEEP\_CFG Register (page = 0x00, address = 0x02) [reset = 0h]

This register configures the regulator, VREF quick charge, I<sup>2</sup>C broadcast and sleep mode.

**Figure 8-3. SLEEP\_CFG Register**

7	6	5	4	3	2	1	0
AREG_SELECT	Reserved		VREF_QCHG[1:0]		I2C_BRDCAST_EN	Reserved	SLEEP_ENZ
R/W-0h	R/W-0h		R/W-0h		R/W-0h	R-0h	R/W-0h

**Table 8-5. SLEEP\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	AREG_SELECT	R/W	0h	The analog supply selection from either the internal regulator supply or the external AREG supply. 0d = External 1.8-V AREG supply (use this setting when AVDD is 1.8 V and short AREG with AVDD) 1d = Internally generated 1.8-V AREG supply using an on-chip regulator (use this setting when AVDD is 3.3 V)
6-5	Reserved	R/W	0h	Reserved
4-3	VREF_QCHG[1:0]	R/W	0h	The duration of the quick-charge for the VREF external capacitor is set using an internal series impedance of 200 Ω. 0d = VREF quick-charge duration of 3.5 ms (typical) 1d = VREF quick-charge duration of 10 ms (typical) 2d = VREF quick-charge duration of 50 ms (typical) 3d = VREF quick-charge duration of 100 ms (typical)
2	I2C_BRDCAST_EN	R/W	0h	I <sup>2</sup> C broadcast addressing setting. 0d = I <sup>2</sup> C broadcast mode disabled; the I <sup>2</sup> C target address is determined based on the ADDR pins 1d = I <sup>2</sup> C broadcast mode enabled; the I <sup>2</sup> C target address is fixed at 1001 100
1	Reserved	R	0h	Reserved
0	SLEEP_ENZ	R/W	0h	Sleep mode setting. 0d = Device is in sleep mode 1d = Device is not in sleep mode

### 8.1.1.4 SHDN\_CFG Register (page = 0x00, address = 0x05) [reset = 5h]

This register configures the device shutdown

**Figure 8-4. SHDN\_CFG Register**

7	6	5	4	3	2	1	0
Reserved		INCAP_QCHG[1:0]		SHDNZ_CFG[1:0]		DREG_KA_TIME[1:0]	
R-0h		R/W-0h		R/W-1h		R/W-1h	

**Table 8-6. SHDN\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	Reserved	R	0h	Reserved
5-4	INCAP_QCHG[1:0]	R/W	0h	The duration of the quick-charge for the external AC-coupling capacitor is set using an internal series impedance of 800 Ω. 0d = INxP, INxM quick-charge duration of 2.5 ms (typical) 1d = INxP, INxM quick-charge duration of 12.5 ms (typical) 2d = INxP, INxM quick-charge duration of 25 ms (typical) 3d = INxP, INxM quick-charge duration of 50 ms (typical)
3-2	SHDNZ_CFG[1:0]	R/W	1h	Shutdown configuration. 0d = DREG is powered down immediately after SHDNZ asserts 1d = DREG remains active to enable a clean shut down until a time-out is reached; after the time-out period, DREG is forced to power off 2d = DREG remains active until the device cleanly shuts down 3d = Reserved

**Table 8-6. SHDN\_CFG Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1-0	DREG_KA_TIME[1:0]	R/W	1h	These bits set how long DREG remains active after SHDNZ asserts. 0d = DREG remains active for 30 ms (typical) 1d = DREG remains active for 25 ms (typical) 2d = DREG remains active for 10 ms (typical) 3d = DREG remains active for 5 ms (typical)

#### 8.1.1.5 ASI\_CFG0 Register (page = 0x00, address = 0x07) [reset = 30h]

This register is the ASI configuration register 0.

**Figure 8-5. ASI\_CFG0 Register**

7	6	5	4	3	2	1	0
ASI_FORMAT[1:0]		ASI_WLEN[1:0]		FSYNC_POL	BCLK_POL	TX_EDGE	TX_FILL
R/W-0h		R/W-3h		R/W-0h	R/W-0h	R/W-0h	R/W-0h

**Table 8-7. ASI\_CFG0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	ASI_FORMAT[1:0]	R/W	0h	ASI protocol format. 0d = TDM mode 1d = I <sup>2</sup> S mode 2d = LJ (left-justified) mode 3d = Reserved
5-4	ASI_WLEN[1:0]	R/W	3h	ASI word or slot length. 0d = 16 bits 1d = 20 bits 2d = 24 bits 3d = 32 bits
3	FSYNC_POL	R/W	0h	ASI FSYNC polarity. 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol
2	BCLK_POL	R/W	0h	ASI BCLK polarity. 0d = Default polarity as per standard protocol 1d = Inverted polarity with respect to standard protocol
1	TX_EDGE	R/W	0h	ASI data output (on the primary and secondary data pin) transmit edge. 0d = Default edge as per the protocol configuration setting in bit 2 (BCLK_POL) 1d = Inverted following edge (half cycle delay) with respect to the default edge setting
0	TX_FILL	R/W	0h	ASI data output (on the primary and secondary data pin) for any unused cycles 0d = Always transmit 0 for unused cycles 1d = Always use Hi-Z for unused cycles

#### 8.1.1.6 ASI\_CFG1 Register (page = 0x00, address = 0x08) [reset = 0h]

This register is the ASI configuration register 1.

**Figure 8-6. ASI\_CFG1 Register**

7	6	5	4	3	2	1	0
TX_LSB	TX_KEEPER[1:0]		TX_OFFSET[4:0]				
R/W-0h	R/W-0h		R/W-0h				

**Table 8-8. ASI\_CFG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	TX_LSB	R/W	0h	ASI data output (on the primary and secondary data pin) for LSB transmissions. 0d = Transmit the LSB for a full cycle 1d = Transmit the LSB for the first half cycle and Hi-Z for the second half cycle

**Table 8-8. ASI\_CFG1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
6-5	TX_KEEPER[1:0]	R/W	0h	ASI data output (on the primary and secondary data pin) bus keeper. 0d = Bus keeper is always disabled 1d = Bus keeper is always enabled 2d = Bus keeper is enabled during LSB transmissions only for one cycle 3d = Bus keeper is enabled during LSB transmissions only for one and half cycles
4-0	TX_OFFSET[4:0]	R/W	0h	ASI data MSB slot 0 offset (on the primary and secondary data pin). 0d = ASI data MSB location has no offset and is as per standard protocol 1d = ASI data MSB location (TDM mode is slot 0 or I <sup>2</sup> S, LJ mode is the left and right slot 0) offset of one BCLK cycle with respect to standard protocol 2d = ASI data MSB location (TDM mode is slot 0 or I <sup>2</sup> S, LJ mode is the left and right slot 0) offset of two BCLK cycles with respect to standard protocol 3d to 30d = ASI data MSB location (TDM mode is slot 0 or I <sup>2</sup> S, LJ mode is the left and right slot 0) offset assigned as per configuration 31d = ASI data MSB location (TDM mode is slot 0 or I <sup>2</sup> S, LJ mode is the left and right slot 0) offset of 31 BCLK cycles with respect to standard protocol

7-6	Reserved	R	0h	Reserved
5-4	DECI_FILT[1:0]	R/W	0h	Decimation filter response. 0d = Linear phase 1d = Low latency 2d = Ultra-low latency 3d = Reserved

**Table 8-70. DSP\_CFG0 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3-2	CH_SUM[1:0]	R/W	0h	Channel summation mode for higher SNR 0d = Channel summation mode is disabled 1d = 2-channel summation mode is enabled to generate a (CH1 + CH2) / 2 and a (CH3 + CH4) / 2 output 2d = 4-channel summation mode is enabled to generate a (CH1 + CH2 + CH3 + CH4) / 4 output 3d = Reserved
1-0	HPF_SEL[1:0]	R/W	1h	High-pass filter (HPF) selection. 0d = Programmable first-order IIR filter for a custom HPF with default coefficient values in P4_R72 to P4_R83 set as the all-pass filter 1d = HPF with a cutoff of $0.00025 \times f_s$ (12 Hz at $f_s = 48$ kHz) is selected 2d = HPF with a cutoff of $0.002 \times f_s$ (96 Hz at $f_s = 48$ kHz) is selected 3d = HPF with a cutoff of $0.008 \times f_s$ (384 Hz at $f_s = 48$ kHz) is selected

#### 8.1.1.69 DSP\_CFG1 Register (page = 0x00, address = 0x6C) [reset = 40h]

This register is the digital signal processor (DSP) configuration register 1.

**Figure 8-69. DSP\_CFG1 Register**

7	6	5	4	3	2	1	0
DVOL_GANG	BIQUAD_CFG[1:0]		DISABLE_SOFT_STEP	AGC_SEL	Reserved		
R/W-0h	R/W-2h		R/W-0h	R/W-0h	R/W-0h		

**Table 8-71. DSP\_CFG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	DVOL_GANG	R/W	0h	DVOL control ganged across channels. 0d = Each channel has its own DVOL CTRL settings as programmed in the CHx_DVOL bits 1d = All active channels must use the channel 1 DVOL setting (CH1_DVOL) irrespective of whether channel 1 is turned on or not
6-5	BIQUAD_CFG[1:0]	R/W	2h	Number of biquads per channel configuration. 0d = No biquads per channel; biquads are all disabled 1d = 1 biquad per channel 2d = 2 biquads per channel 3d = 3 biquads per channel
4	DISABLE_SOFT_STEP	R/W	0h	Soft-stepping disable during DVOL change, mute, and unmute. 0d = Soft-stepping enabled 1d = Soft-stepping disabled
3	AGC_SEL	R/W	0h	AGC selection when is enabled for any channel. 0d = AGC is not selected 1d = AGC is selected
2-0	Reserved	R/W	0h	Reserved

#### 8.1.1.70 AGC\_CFG0 Register (page = 0x00, address = 0x70) [reset = E7h]

This register is the automatic gain controller (AGC) configuration register 0.

**Figure 8-70. AGC\_CFG0 Register**

7	6	5	4	3	2	1	0
AGC_LVL[3:0]				AGC_MAXGAIN[3:0]			
R/W-Eh				R/W-7h			

**Table 8-72. AGC\_CFG0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	AGC_LVL[3:0]	R/W	Eh	AGC output signal target level. 0d = Output signal target level is –6 dB 1d = Output signal target level is –8 dB 2d = Output signal target level is –10 dB 3d to 13d = Output signal target level is as per configuration 14d = Output signal target level is –34 dB 15d = Output signal target level is –36 dB
3-0	AGC_MAXGAIN[3:0]	R/W	7h	AGC maximum gain allowed. 0d = Maximum gain allowed is 3 dB 1d = Maximum gain allowed is 6 dB 2d = Maximum gain allowed is 9 dB 3d to 11d = Maximum gain allowed is as per configuration 12d = Maximum gain allowed is 39 dB 13d = Maximum gain allowed is 42 dB 14d to 15d = Reserved

**8.1.1.71 IN\_CH\_EN Register (page = 0x00, address = 0x73) [reset = F0h]**

This register is the input channel enable configuration register.

**Figure 8-71. IN\_CH\_EN Register**

7	6	5	4	3	2	1	0

**Table 8-75. PWR\_CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	MICBIAS_PDZ	R/W	0h	Power control for MICBIAS. 0d = Power down MICBIAS 1d = Power up MICBIAS
6	ADC_PDZ	R/W	0h	Power control for ADC and PDM channels. 0d = Power down all ADC and PDM channels 1d = Power up all enabled ADC and PDM channels
5	PLL_PDZ	R/W	0h	Power control for the PLL. 0d = Power down the PLL 1d = Power up the PLL

**Table 8-75. PWR\_CFG Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
4	DYN_CH_PUPD_EN	R/W	0h	Dynamic channel power-up, power-down enable. 0d = Channel power-up, power-down is not supported if any channel recording is on 1d = Channel can be powered up or down individually, even if channel recording is on. Do not power down Channel 1 in this mode
3-2	DYN_MAXCH_SEL[1:0]	R/W	0h	Dynamic mode maximum channel select configuration. 0d = Channel 1 and channel 2 are used with dynamic channel power-up, power-down feature enabled 1d = Channel 1 to channel 4 are used with dynamic channel power-up, power-down feature enabled 2d = Channel 1 to channel 6 are used with dynamic channel power-up, power-down feature enabled 3d = Channel 1 to channel 8 are used with dynamic channel power-up, power-down feature enabled
1-0	Reserved	R/W	0h	Reserved

**8.1.1.74 DEV\_STS0 Register (page = 0x00, address = 0x76) [reset = 0h]**

This register is the device status value register 0.

**Figure 8-74. DEV\_STS0 Register**

7	6	5	4	3	2	1	0
CH1_STATUS	CH2_STATUS	CH3_STATUS	CH4_STATUS	CH5_STATUS	CH6_STATUS	CH7_STATUS	CH8_STATUS
R-0h	R-0h	R-0h	R-0h	R-0h	R-0h	R-0h	R-0h

**Table 8-76. DEV\_STS0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7	CH1_STATUS	R	0h	ADC or PDM channel 1 power status. 0d = ADC or PDM channel is powered down 1d = ADC or PDM channel is powered up
6	CH2_STATUS	R	0h	ADC or PDM channel 2 power status. 0d = ADC or PDM channel is powered down 1d = ADC or PDM channel is powered up
5	CH3_STATUS	R	0h	ADC or PDM channel 3 power status. 0d = ADC or PDM channel is powered down 1d = ADC or PDM channel is powered up
4	CH4_STATUS	R	0h	ADC or PDM channel 4 power status. 0d = ADC or PDM channel is powered down 1d = ADC or PDM channel is powered up
3	CH5_STATUS	R	0h	PDM channel 5 power status. 0d = PDM channel is powered down 1d = PDM channel is powered up
2	CH6_STATUS	R	0h	PDM channel 6 power status. 0d = PDM channel is powered down 1d = PDM channel is powered up
1	CH7_STATUS	R	0h	PDM channel 7 power status. 0d = PDM channel is powered down 1d = PDM channel is powered up
0	CH8_STATUS	R	0h	PDM channel 8 power status. 0d = PDM channel is powered down 1d = PDM channel is powered up

### 8.1.1.75 DEV\_STS1 Register (page = 0x00, address = 0x77) [reset = 80h]

This register is the device status value register 1.

**Figure 8-75. DEV\_STS1 Register**

7	6	5	4	3	2	1	0
MODE_STS[2:0]			Reserved				
R-4h			R-0h				

**Table 8-77. DEV\_STS1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	MODE_STS[2:0]	R	4h	Device mode status. 4d = Device is in sleep mode or software shutdown mode 6d = Device is in active mode with all ADC or PDM channels turned off 7d = Device is in active mode with at least one ADC or PDM channel turned on
4-0	Reserved	R	0h	Reserved

### 8.1.1.76 I2C\_CKSUM Register (page = 0x00, address = 0x7E) [reset = 0h]

This register returns the I<sup>2</sup>C transactions checksum value.

**Figure 8-76. I2C\_CKSUM Register**

7	6	5	4	3	2	1	0
I2C_CKSUM[7:0]							
R/W-0h							

**Table 8-78. I2C\_CKSUM Register Field Descriptions**

Bit	Field	Type	Reset	Description
7-0	I2C_CKSUM[7:0]	R/W	0h	These bits return the I <sup>2</sup> C transactions checksum value. Writing to this register resets the checksum to the written value. This register is updated on writes to other registers on all pages.

## 8.2 Programmable Coefficient Registers

### 8.2.1 Programmable Coefficient Registers: Page = 0x02

This register page (shown in [Table 8-79](#)) consists of the programmable coefficients for the biquad 1 to biquad 6 filters. To optimize the coefficients register transaction time for page 2, page 3, and page 4, the device also supports (by default) auto-incremented pages for the I<sup>2</sup>C and SPI burst writes and reads. After a transaction of register address 0x7F, the device auto increments to the next page at register 0x08 to transact the next coefficient value. These programmable coefficients are 32-bit, two's complement numbers. For a successful coefficient register transaction, the host device must write and read all four bytes starting with the most significant byte (BYT1) for a target coefficient register transaction. When using SPI for a coefficient register read transaction, the device transmits the first byte as a dummy read byte; therefore, the host must read five bytes, including the first dummy read byte and the last four bytes corresponding to the coefficient register value starting with the most significant byte (BYT1).

**Table 8-79. Page 0x02 Programmable Coefficient Registers**

ADDRESS	REGISTER	RESET	DESCRIPTION
0x00	PAGE[7:0]	0x00	<a href="#">Device page register</a>
0x08	BQ1_N0_BYT1[7:0]	0x7F	Programmable biquad 1, N0 coefficient byte[31:24]
0x09	BQ1_N0_BYT2[7:0]	0xFF	Programmable biquad 1, N0 coefficient byte[23:16]
0x0A	BQ1_N0_BYT3[7:0]	0xFF	Programmable biquad 1, N0 coefficient byte[15:8]

## 8.2.2 Programmable Coefficient Registers: Page = 0x03

This register page (shown in [Table 8-80](#)) consists of the programmable coefficients for the biquad 7 to biquad 12 filters. To optimize the coefficients register transaction time for page 2, page 3, and page 4, the device also supports (by default) auto-incremented pages for the I<sup>2</sup>C and SPI burst writes and reads. After a transaction of register address 0x7F, the device auto increments to the next page at register 0x08 to transact the next coefficient value. These programmable coefficients are 32-bit, two's complement numbers. For a successful coefficient register transaction, the host device must write and read all four bytes starting with the most significant byte (BYT1) for a target coefficient register transaction. When using SPI for a coefficient register read transaction, the device transmits the first byte as a dummy read byte; therefore, the host must read five bytes, including the first dummy read byte and the last four bytes corresponding to the coefficient register value starting with the most significant byte (BYT1).

### 8.2.3 Programmable Coefficient Registers: Page = 0x04

This register page (shown in [Table 8-81](#)) consists of the programmable coefficients for mixer 1 to mixer 4 and the first-order IIR filter. All mixer coefficients are 32-bit, two's complement numbers using a 1.31 number format. The value of 0x7FFFFFFF is equivalent to +1 (0-dB gain), the value 0x00000000 is equivalent to mute (zero data) and all values in between set the mixer attenuation computed using [Equation 4](#). If the MSB is set to '1' then the attenuation remains the same but the signal phase is inverted. All IIR filter programmable coefficients are 32-bit, two's complement numbers. For a successful coefficient register transaction, the host device must write and read all the four bytes starting with the most significant byte (BYT1) for a target coefficient register transaction. While using SPI for a coefficient register read transaction, the device gives out first byte as dummy read byte therefore the host must read five bytes which includes first byte as dummy read byte and the last four bytes corresponds to the coefficient register value starting with the most significant byte (BYT1).

$$\text{hex2dec}(\text{value}) / 2^{31}$$

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The PCM3140-Q1 is a multichannel, high-performance audio analog-to-digital converter (ADC) that supports output sample rates of up to 768 kHz. The device supports either up to four analog microphones or up to eight digital pulse density modulation (PDM) microphones for simultaneous recording applications.

Communication to the PCM3140-Q1 for configuration of the control registers is supported using an I<sup>2</sup>C or SPI interface. The device supports a highly flexible, audio serial interface (TDM, I<sup>2</sup>S, and LJ) to transmit audio data seamlessly in the system across devices.

### 9.2 Typical Applications

#### 9.2.1 Four-Channel Analog Microphone Recording

Figure 9-1 shows a typical configuration of the PCM3140-Q1 for an application using four analog microelectrical-mechanical system (MEMS) microphones for simultaneous recording operation with an I<sup>2</sup>C control interface and a time-division multiplexing (TDM) audio data target interface. For best distortion performance, use input AC-coupling capacitors with a low-voltage coefficient.

Figure 9-1. Four-Channel Analog Microphone Recording Diagram

### 9.2.1.1 Design Requirements

Table 9-1 lists the design parameters for this application.

**Table 9-1. Design Parameters**

KEY PARAMETER	SPECIFICATION
AVDD	3.3 V
AVDD supply current consumption	> 23 mA (PLL on, four-channel recording, $f_s = 48$ kHz)
IOVDD	1.8 V or 3.3 V
Maximum MICBIAS current	10 mA (MICBIAS voltage is the same as AVDD)

### 9.2.1.2 Detailed Design Procedure

This section describes the necessary steps to configure the PCM3140-Q1 for this specific application. The following steps provide a sequence of items that must be executed in the time between powering the device up and reading data from the device or transitioning from one mode to another mode of operation.

1. Apply power to the device:
  - a. Power-up the IOVDD and AVDD power supplies, keeping the SHDNZ pin voltage low
  - b. The device now goes into hardware shutdown mode (ultra-low-power mode < 1  $\mu$ A)
2. Transition from hardware shutdown mode to sleep mode (or software shutdown mode):
  - a. Release SHDNZ only when the IOVDD and AVDD power supplies settle to the steady-state operating voltage
  - b. Wait for at least 1 ms to allow the device to initialize the internal registers
  - c. The device now goes into sleep mode (low-power mode < 10  $\mu$ A)
3. Transition from sleep mode to active mode whenever required for the recording operation:
  - a. Wake up the device by writing to P0\_R2 to disable sleep mode
  - b. Wait for at least 1 ms to allow the device to complete the internal wake-up sequence
  - c. Override default configuration registers or programmable coefficients value as required (this step is optional)
  - d. Enable all desired input channels by writing to P0\_R115
  - e. Enable all desired audio serial interface output channels by writing to P0\_R116
  - f. Power-up the ADC, MICBIAS, and PLL by writing to P0\_R117
  - g. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio

This specific step can be done at any point in the sequence after step a.

See the [Section 7.3.2](#) section for supported sample rates and the BCLK to FSYNC ratio.

- h. The device recording data are now sent to the host processor via the TDM audio serial data bus
4. Transition from active mode to sleep mode (again) as required in the system for low-power operation:
  - a. Enter sleep mode by writing to P0\_R2 to enable sleep mode
  - b. Wait at least 6 ms (when FSYNC = 48 kHz) for the volume to ramp down and for all blocks to power down
  - c. Read P0\_R119 to check the device shutdown and sleep mode status
  - d. If the device P0\_R119\_D7 status bit is 1'b1 then stop FSYNC and BCLK in the system
  - e. The device now goes into sleep mode (low-power mode < 10  $\mu$ A) and retains all register values
5. Transition from sleep mode to active mode (again) as required for the recording operation:
  - a. Wake up the device by writing to P0\_R2 to disable sleep mode
  - b. Wait for at least 1 ms to allow the device to complete the internal wake-up sequence
  - c. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio
  - d. The device recording data are now sent to the host processor via the TDM audio serial data bus
6. Repeat step 4 and step 5 as required for mode transitions
7. Assert the SHDNZ pin low to enter hardware shutdown mode (again) at any time
8. Follow step 2 onwards to exit hardware shutdown mode (again)

### 9.2.1.2.1 Example Device Register Configuration Script for EVM Setup

This section provides a typical EVM I<sup>2</sup>C register control script that shows how to set up the PCM3140-Q1 in a four-channel analog microphone recording mode with differential inputs.

```
# Key: w 98 XX YY ==> write to I2C address 0x98, to register 0xXX, data 0xYY
#           # ==> comment delimiter
#
# The following list gives an example sequence of items that must be executed in the time
# between powering the device up and reading data from the device. Note that there are
# other valid sequences depending on which features are used.
#
# See the PCM3140-Q1EVM user guide for jumper settings and audio connections.
#
# Differential 4-channel : INP1/INM1 - Ch1, INP2/INM2 - Ch2, INP3/INM3 - Ch3 and INP4/INM4 - Ch4
# FSYNC = 44.1 kHz (Output Data Sample Rate), BCLK = 11.2896 MHz (BCLK/FSYNC = 256)
#####
#
#
# Power up IOVDD and AVDD power supplies keeping SHDNZ pin voltage LOW
# Wait for IOVDD and AVDD power supplies to settle to steady state operating voltage range.
# Release SHDNZ to HIGH.
# Wait for 1ms.
#
# Wake-up device by I2C write into P0_R2 using internal AREG
w 98 02 81
#
# Configure CH1_INSRC as analog Input by I2C write into P0_R60
w 98 3C 00
#
# Configure CH2_INSRC as analog Input by I2C write into P0_R65
w 98 41 00
#
# Configure CH3_INSRC as analog Input by I2C write into P0_R70
w 98 46 00
#
# Configure CH4_INSRC as analog Input by I2C write into P0_R75
w 98 4B 00
#
# Enable Input Ch-1 to Ch-4 by I2C write into P0_R115
w 98 73 F0
#
# Enable ASI Output Ch-1 to Ch-4 slots by I2C write into P0_R116
w 98 74 F0
#
# Power-up ADC, MICBIAS and PLL by I2C write into P0_R117
w 98 75 E0
#
# Apply FSYNC = 44.1 kHz and BCLK = 11.2896 MHz and
# Start recording data by host on ASI bus with TDM protocol 32-bits channel wordlength
```

### 9.2.1.3 Application Curves

Measurements are done on the EVM by feeding the device analog input signal using audio precision.

**Figure 9-2. FFT With a -60-dBr Input**

**Figure 9-3. THD+N vs Input Amplitude**

## 9.2.2 Eight-Channel Digital PDM Microphone Recording

Figure 9-1 shows a typical configuration of the PCM3140-Q1 for an application using eight digital PDM MEMS microphones with simultaneous recording operation using an I<sup>2</sup>C control interface and the TDM audio data target interface.

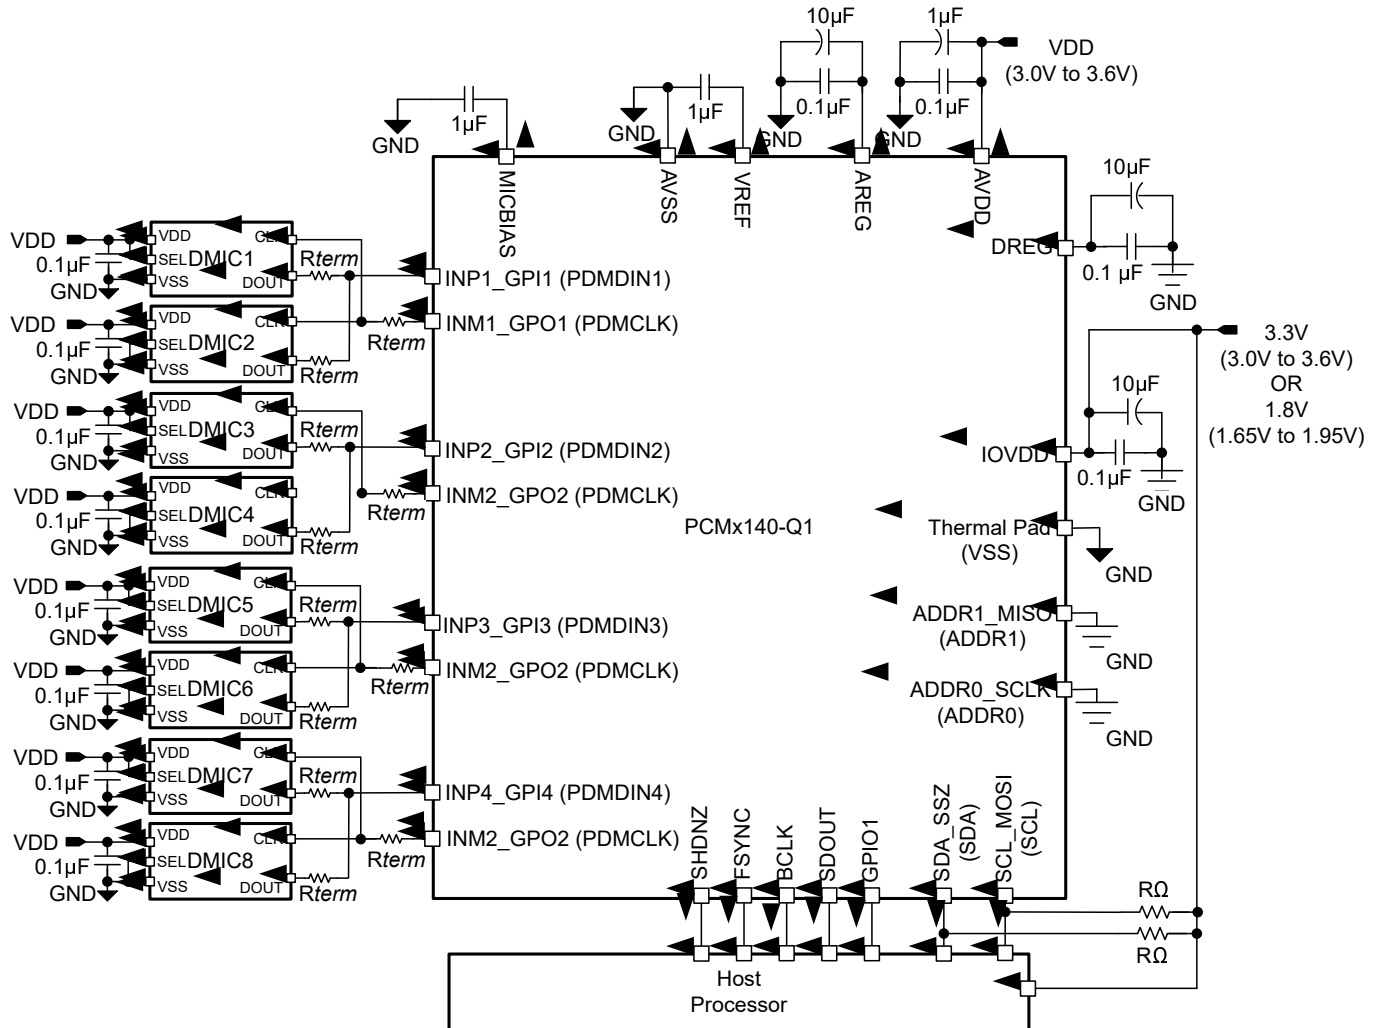

Figure 9-4. Eight-Channel Digital PDM Microphone Recording Diagram

### 9.2.2.1 Design Requirements

Table 9-2 lists the design parameters for this application.

Table 9-2. Design Parameters

KEY PARAMETER	SPECIFICATION
AVDD	3.3 V
AVDD supply current consumption	11.7 mA (PLL on, eight-channel recording, $f_s = 48$ kHz)
IOVDD	1.8 V or 3.3 V

### 9.2.2.2 Detailed Design Procedure

This section describes the necessary steps to configure the PCM3140-Q1 for this specific application. The following steps provide a sequence of items that must be executed in the time between powering the device up and reading data from the device or transitioning from one mode to another mode of operation.

1. Apply power to the device:
  - a. Power up the IOVDD and AVDD power supplies, keeping the SHDNZ pin voltage low
  - b. The device now goes into hardware shutdown mode (ultra-low-power mode < 1  $\mu$ A)
2. Transition from hardware shutdown mode to sleep mode (or software shutdown mode):
  - a. Release SHDNZ only when the IOVDD and AVDD power supplies settle to the steady-state operating voltage
  - b. Wait for at least 1 ms to allow the device to initialize the internal registers initialization
  - c. The device now goes into sleep mode (low-power mode < 10  $\mu$ A)
3. Transition from sleep mode to active mode whenever required for the recording operation:
  - a. Wake up the device by writing to P0\_R2 to disable sleep mode
  - b. Wait for at least 1 ms to allow the device to complete the internal wake-up sequence
  - c. Override the default configuration registers or programmable coefficients value as required (this step is optional)
  - d. Configure channel 1 to channel 4 (CHx\_INSRC) for the digital microphone as the input source for recording
  - e. Configure GPO1 to GPO4 (GPOx\_CFG) as the PDMCLK output
  - f. Configure GPI1 to GPI4 (GPI1x\_CFG) as PDMDIN1 to PDMDIN4, respectively
  - g. Enable all desired input channels by writing to P0\_R115
  - h. Enable all desired audio serial interface output channels by writing to P0\_R116
  - i. Power-up the ADC and PLL by writing to P0\_R117
  - j. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio

This specific step can be done at any point in the sequence after step a.

See the [Section 7.3.2](#) section for supported sample rates and the BCLK to FSYNC ratio.

- k. The device recording data is now sent to the host processor using the TDM audio serial data bus
4. Transition from active mode to sleep mode (again) as required in the system for low-power operation:
  - a. Enter sleep mode by writing to P0\_R2 to enable sleep mode
  - b. Wait at least 6 ms (when FSYNC = 48 kHz) for the volume to ramp down and for all blocks to power down
  - c. Read P0\_R119 to check the device shutdown and sleep mode status
  - d. If the device P0\_R119\_D7 status bit is 1'b1 then stop FSYNC and BCLK in the system
  - e. The device now goes into sleep mode (low-power mode < 10  $\mu$ A) and retains all register values
5. Transition from sleep mode to active mode (again) as required for the recording operation:
  - a. Wake up the device by writing to P0\_R2 to disable sleep mode
  - b. Wait at least 1 ms to allow the device to complete the internal wake-up sequence
  - c. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio
  - d. The device recording data are now sent to the host processor using the TDM audio serial data bus
6. Repeat step 4 and step 5 as required for mode transitions
7. Assert the SHDNZ pin low to enter hardware shutdown mode (again) at any time
8. Follow step 2 onwards to exit hardware shutdown mode (again)

### 9.2.2.2.1 Example Device Register Configuration Script for EVM Setup

This section provides a typical EVM I<sup>2</sup>C register control script that shows how to set up the PCM3140-Q1 in an eight-channel digital PDM microphone recording mode.

```
# Key: w 98 XX YY ==> write to I2C address 0x98, to register 0xXX, data 0xYY
#           # ==> comment delimiter
#
# The following list gives an example sequence of items that must be executed in the time
# between powering the device up and reading data from the device. Note that there are
# other valid sequences depending on which features are used.
#
# See the PCM3140-Q1EVM user guide for jumper settings and audio connections.
#
# PDM 8-channel : PDMDIN1 - Ch1 and Ch2, PDMDIN2 - Ch3 and Ch4,
#                 PDMDIN3 - Ch5 and Ch6, PDMDIN4 - Ch7 and Ch8
# FSYNC = 44.1 kHz (Output Data Sample Rate), BCLK = 11.2896 MHz (BCLK/FSYNC = 256)
#####
#
# Power up IOVDD and AVDD power supplies keeping SHDNZ pin voltage LOW
# wait for IOVDD and AVDD power supplies to settle to steady state operating voltage range.
# Release SHDNZ to HIGH.
# wait for 1ms.

#
# Apply FSYNC = 44.1 kHz and BCLK = 11.2896 MHz and
# Start recording data by host on ASI bus with TDM protocol 32-bits channel wordlength
```

## 9.3 What to Do and What Not to Do

### 9.3.1

In controller mode operation with I<sup>2</sup>S or LJ format, the device generates FSYNC half a cycle earlier than the normal protocol timing behavior expected. This timing behavior can still function for most of the system, however for further details and a suggested workaround for this weakness, see the [Configuring and Operating the TLV320ADCx140 as an Audio Bus Master application report](#).

The automatic gain controller (AGC) feature has some limitation when using sampling rates lower than 44.1 kHz. For further details about this limitation, see the [Using the Automatic Gain Controller \(AGC\) in TLV320ADCx140 application report](#).

## 9.4 Power Supply Recommendations

The power-supply sequence between the IOVDD and AVDD rails can be applied in any order. However, keep the SHDNZ pin low until the IOVDD supply voltage settles to a stable and supported operating voltage range. After all supplies are stable, set the SHDNZ pin high to initialize the device.

For the supply power-up requirement,  $t_1$  and  $t_2$  must be at least 100  $\mu$ s. For the supply power-down requirement,  $t_3$  and  $t_4$  must be at least 10 ms. This timing (as shown in [Figure 9-5](#)) allows the device to ramp down the volume on the record data, power down the analog and digital blocks, and put the device into hardware shutdown mode. The device can also be immediately put into hardware shutdown mode from active mode if SHDNZ\_CFG[1:0] is set to 2'b00 using the P0\_R5\_D[3:2] bits. In that case,  $t_3$  and  $t_4$  are required to be at least 100  $\mu$ s.

**Figure 9-5. Power-Supply Sequencing Requirement Timing Diagram**

Make sure that the supply ramp rate is slower than 1 V/ $\mu$ s and that the wait time between a power-down and a power-up event is at least 100 ms. For supply ramp rate slower than 0.1 V/ms, host device must apply a software reset as first transaction before doing any device configuration.

After releasing SHDNZ, or after a software reset, delay any additional I<sup>2</sup>C or SPI transactions to the device for at least 2 ms to allow the device to initialize the internal registers. See the [Section 7.4](#) section for details on how the device operates in various modes after the device power supplies are settled to the recommended operating voltage levels.

The PCM3140-Q1 supports a single AVDD supply operation by integrating an on-chip digital regulator, DREG, and an analog regulator, AREG. However, if the AVDD voltage is less than 1.98 V in the system, then short the AREG and AVDD pins onboard and do not enable the internal AREG by keeping the AREG\_SELECT bit to 1b'0 (default value) of P0\_R2. If the AVDD supply used in the system is higher than 2.7 V, then the host device can set AREG\_SELECT to 1b'1 while exiting sleep mode to allow the device internal regulator to generate the AREG supply.

## 9.5 Layout

### 9.5.1 Layout Guidelines

Each system design and printed circuit board (PCB) layout is unique. The layout must be carefully reviewed in the context of a specific PCB design. However, the following guidelines can optimize the device performance:

- Connect the thermal pad to ground. Use a via pattern to connect the device thermal pad, which is the area directly under the device, to the ground planes. This connection helps dissipate heat from the device.
- The decoupling capacitors for the power supplies must be placed close to the device pins.
- The supply decoupling capacitors must be used ceramic type with low ESR.

Input coupling capacitors must be film type for the best performance. See [Selecting Capacitors to Minimize Distortion in Audio Applications](#) for details on how input coupling capacitor type impacts THD+N performance.

- Route the analog differential audio signals differentially on the PCB for better noise immunity. Avoid crossing digital and analog signals to prevent undesirable crosstalk.
- The device internal voltage references must be filtered using external capacitors. Place the filter capacitors near the VREF pin for optimal performance.
- Directly tap the MICBIAS pin to avoid common impedance when routing the biasing or supply traces for multiple microphones to avoid coupling across microphones.
- Directly short the VREF and MICBIAS external capacitors ground terminal to the AVSS pin without using any vias for this connection trace.
- Place the MICBIAS capacitor (with low equivalent series resistance) close to the device with minimal trace impedance.
- Use ground planes to provide the lowest impedance for power and signal current between the device and the decoupling capacitors. Treat the area directly under the device as a central ground area for the device, and all device grounds must be connected directly to that area.

### 10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 10.4 Trademarks

Burr-Brown™, PurePath™, and TI E2E™ are trademarks of Texas Instruments.  
All trademarks are the property of their respective owners.

### 10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
March 2024	*	Initial Release

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">PCM3140QRGERQ1</a>	Active	Production	VQFN (RGE)   24	3000   LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	PCM3140 Q1
PCM3140QRGERQ1.A	Active	Production	VQFN (RGE)   24	3000   LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	PCM3140 Q1

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
PCM3140QRGERQ1	VQFN	RGE	24	3000	330.0	12.4	4.25	4.25	1.15	8.0	12.0	Q2

## TAPE AND REEL BOX DIMENSIONS

## NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slue271](http://www.ti.com/lit/slue271)).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
