

EVM User's Guide: PCMx140Q1EVM-PDK

PCMx140Q1EVM-PDK Evaluation Module

Description

The PCMx140Q1EVM-PDK is an evaluation module (EVM) that allows the user to test the capabilities of the PCMx140-Q1 family of devices, which is a quad-channel, high-performance audio analog-to-digital converter (ADC). The PCMx140-Q1 is intended for voice-activated systems, professional microphones, audio conferencing, portable computing, communication, entertainment, and automotive applications. The PCMx140Q1EVM-PDK is paired with the AC-MB (included in the kit), a flexible motherboard that provides power, control, and digital audio data to the EVM.

Get Started

1. Order the EVM from the [PCMx140Q1EVM-PDK](#) product page.
2. Download the latest PCMx140-Q1 data sheet.
3. Request access and download PPC3 GUI and the associated PCMx140Q1EVM-PDK app from the [PCMx140Q1EVM-PDK](#) product page.

Features

- Complete performance demonstration kit (PDK) for PCMx140-Q1
- High-performance audio ADC: 106, 108, or 113-dB dynamic range
- Dynamic Range Enhancer (DRE) improves dynamic range performance in far field applications (PCM5140-Q1, and PCM6140-Q1 only)
- Rail-to-Rail CMRR performance mode (PCM6140-Q1 only)
- Onboard microphone provided for voice-recording testing
- Direct access to digital audio signals and control interface for simple end-system integration
- USB connection to PC provides power, control, and streaming audio data for easy evaluation
- Easy evaluation and demonstration via PurePath™ Console software platform (PUREPATHCONSOLE)

Applications

- [Microphone array systems](#)
- Voice-activated digital assistants
- Teleconferencing systems
- [Security and surveillance systems](#)

1 Evaluation Module Overview

1.1 Introduction

This user's guide describes the function and use of the PCMx140Q1EVM-PDK. This document includes the hardware configuration instructions, a quick-start guide, jumper and connector descriptions, software description, schematics, and printed circuit board (PCB) layout that demonstrate TI's recommended practices for these devices.

1.2 Kit Contents

- ADC3140EVM-PDK evaluation module
- Audio converters motherboard (AC-MB)

1.3 Specification

The PCMx140Q1EVM-PDK evaluation module (EVM) paired with the AC-MB, a flexible motherboard which provides power, control, and digital audio data to the evaluation module allows the user to record and playback audio signals. The configuration for the PCMx140-Q1 family of devices is done through the PurePath Console 3 (PPC3) GUI.

1.4 Device Information

The PCMx140Q1EVM-PDK is an evaluation module (EVM) designed to demonstrate the performance and functionality of the PCMx140-Q1 family of devices. This family includes the devices shown in [Table 1-1](#) with differences in performance and function noted.

Table 1-1. PCMx140-Q1 Family

Device	SNR Without DRE (dB)	SNR With DRE (dB)
PCM3140-Q1	106	N/A
PCM5140-Q1	108	120
PCM6140-Q1	112	123

2 Hardware

2.1 System Overview

Figure 2-1 shows an overview of the system.

Figure 2-1. System Overview

2.2 Hardware Overview

The evaluation kit consists of the PCMx140Q1EVM daughterboard and the AC-MB motherboard. The motherboard is used to provide power, control, and digital audio signals to the evaluation module. The daughterboard contains the PCMx140-Q1 device and the input connections. A detailed functional overview of the PCMx140Q1EVM system is described in [Section 2.1](#).

2.2.1 AC-MB Settings

2.2.1.1 Audio Serial Interface Settings

The AC-MB provides the digital audio digital signals to the evaluation module from the universal serial bus (USB), optical, stereo jack, and external audio serial interface (ASI) header. [Figure 2-2](#) shows a block diagram of the ASI routing on the AC-MB.

Figure 2-2. AC-MB Audio Serial Interface Routing

Switch SW2 on the AC-MB selects the audio serial bus that interfaces with the TLV320ADC5140EVB. Next to switch SW2, the AC-MB has a quick reference table to identify the audio serial interface source options and switch settings. The AC-MB acts as the controller for the audio serial interface, with three different modes of operation (see [Figure 2-3](#)): USB, optical or analog, or external ASI.

2.2.1.1.1 USB

The serial interface clocks and data are provided from the USB interface. The sampling rate and format are determined by the USB audio class driver on the operating system. The default settings for the USB audio interface are 32-bit frame size, 48-kHz sampling rate, BCLK and FSYNC ratio is 256, and the format is time-division multiplexing (TDM).

2.2.1.1.2

The AC-MB is detected by the OS as an audio device with the name *TI USB Audio UAC2.0*. [Figure 2-3](#) shows the AC-MB audio setting for the USB mode of operation.

Figure 2-3. AC-MB USB Audio Setting

2.2.1.1.3 Optical or Auxiliary Analog Audio Input

Serial interface signals are provided from the PCM9211 digital transceiver, which is capable of sending digital data to the EVB from an analog input or optical input. Meanwhile, the data from the EVB can be streamed through the optical output. Figure 2-4 shows the AC-MB audio setting for the optical and analog mode of operation.

Figure 2-4. AC-MB Optical or Auxiliary Analog Audio Setting

The optical output of the AC-MB streams the data captured on the EVM with the format determined by the input source used. When there is an optical input connected, the LOCK LED must be ON, and the PCM9211 streams the audio serial interface clocks with the format determined by the optical input frame. The digital data from the optical input is streamed to the evaluation module. If the optical input is not connected, the PCM9211 captures the input signal provided through the analog input, and streams the signal to the evaluation module. This feature can be useful when a digital input DAC is connected to the AC-MB, providing an analog input for quick evaluation. In Auxiliary Analog Audio mode the audio serial interface format is fixed to a 24-bit, 48-kHz, I²S mode.

2.2.1.1.4 External

In this mode, the audio serial interface clocks for the evaluation board are provided through connector J7 from an external source. This architecture allows the use of an external system to communicate with the evaluation board, such as a different host processor or test equipment (for instance, Audio Precision PSIA). The clocks generated from the USB interface and PCM9211 are isolated with this setting. [Figure 2-5](#) shows the AC-MB audio setting for the external mode of operation.

Figure 2-5. AC-MB External Audio Setting

Figure 2-6 shows how to connect the external audio interface, with the bottom row for the signal and the top row for ground.

Figure 2-6. AC-MB Connection with External Audio Serial Interface

2.2.1.2 AC-MB Power Supply

The complete EVM system is powered from a single 5-V power supply. However, the motherboard has different low-dropout regulators (LDOs) integrated that provide the required power supplies to the different blocks of the board. Figure 2-7 shows a block diagram depicting the power structure of the AC-MB.

Figure 2-7. Power-Supply Distribution of the AC-MB

The AC-MB can be powered from the host computer by using the USB 5-V power supply (VBUS) by shorting header J5, USB POWER. Additionally, the AC-MB can be powered from an external power supply connected to terminal J4, EXTERNAL POWER. Header J5 must be open for external supply operation. The IOVDD voltage for the digital signals that is provided to the evaluation module is generated on the motherboard from the main power supply (USB or external). The voltage levels available are 1.8 V and 3.3 V, and can be selected via the J3 header IOVDD. For 1.8-V operation, short pins 2 and 3 of header J3; for 3.3-V operation, short pins 1 and 2. When the motherboard is fully powered and the power supplies from the onboard LDOs are correct, the green POWER LED (D3) turns ON. The USB READY LED indicates that a successful USB communication is established between the AC-MB and the host computer.

2.2.2 PCMx140Q1EVM-PDK Hardware Settings

The PCMx140-Q1 evaluation module has several input configuration options and offers extensive flexibility to allow the user to evaluate the device across multiple operation modes. The different operation modes are highlighted in this section. The INxP and INxM pins of the PCMx140-Q1 can optionally connect to an onboard microphone for quick evaluation, and can be optionally configured to bypass the input decoupling capacitors for evaluating the functionality of the digital microphones or GPIOs. [Figure 2-8](#) shows the architecture of the inputs to the evaluation module.

Figure 2-8. PCMx140Q1EVM Input Architecture

When using I2C control, headers J18 and J19 pull down the device pins ADDR0 and ADDR1. This allows the EVM to respond to the 4 different I2C addresses available in the device. [Table 2-1](#) shows the 7bit I2C addresses that correspond to each combination of J18 and J19.

Table 2-1. I2C Address Selection

J18	J19	Address
0	0	0x4C
0	1	0x4D
1	0	0x4E
1	1	0x4F

2.2.2.1 Line Inputs

For the line input configuration (shown in [Figure 2-9](#)), the PCMx140Q1 captures the audio signal provided through terminals J2 (IN1), J3 (IN2), J4 (IN3), and J5 (IN4). The input accepted in this mode is a differential, 2-VRMS, full-scale audio signal. If a single-ended source is used, the 1-VRMS signal is supported.

Figure 2-9. PCMx140Q1EVM Connection for Line Input Application

2.2.2.2 Onboard Microphone Input

For the onboard microphone input configuration (shown in [Figure 2-10](#)), the PCMx140Q1 records the audio captured from the microphones located on the bottom edge of the board. MICBIAS is used to power the onboard microphone, so header J14 must be shorted. There must not be any connections to J1 during onboard microphone use to preserve the performance of the microphone.

Figure 2-10. PCMx140Q1EVM Connection for the Onboard Microphone Test

3 Software

3.1 Software Overview

Texas Instruments' PurePath™ Console 3 (PPC3) graphical development suite is a program that serves as a platform for many of TI's audio products. PPC3 is designed to simplify the evaluation, configuration, and debug process associated with the development of audio products.

3.1.1 PurePath Console 3 Installation

The PCMx140Q1EVM-PDK GUI is an application that installs into the PPC3 framework. PPC3 must be installed prior to downloading the PCMx140Q1EVM-PDK GUI. To download the PPC3, visit www.ti.com/tool/PUREPATHCONSOLE and request access. If the PPC3 is already installed, proceed to [Section 3.1.2](#). [Figure 3-1](#) shows the setup directory for the PPC3 installation.

Figure 3-1. PurePath Console 3 Installation

Open the PPC3 installer and follow the instructions in the setup wizard.

3.1.2 PCMx140Q1EVM GUI Installation

3.1.2.1 Software Setup

Open the PPC3 application in the directory chosen for the GUI installation in [Section 3.1.1](#). [Figure 3-2](#) shows the resulting app center window. Click on the *PCMx140Q1* app tile.

Figure 3-2. PurePath Console 3 App Center

The PCMx140Q1 GUI is designed to work with up to four devices at any time. As shown in [Figure 3-3](#), choose the 1 device radial button and click *New*.

Figure 3-3. Initial GUI Configuration

As shown in [Figure 3-4](#), the GUI opens to the *Audio Config* tab.

Figure 3-4. Audio Config Tab

Before changing any parameters, check the lower left corner of the PPC3 window, as shown in [Figure 3-5](#), to verify that the EVM is connected. If there is not an EVM detected, then the text reads *PCMx140Q1 offline*. If the EVM is detected, then a *Connect* button appears. Clicking this button connects the hardware.

Figure 3-5. Hardware Connect

When the hardware is connected, the *Connect* button changes to read *Disconnect*, and the device is ready to be configured.

3.2 Quick Start

Configure the AC-MB for the USB audio (TDM) and the PCMx140Q1EVM for the onboard microphone input.

All configurations for this example are done on the audio configuration tab. In the *Audio Configuration* block in the lower right portion of the audio configuration tab (as shown in [Figure 3-6](#)), select a word length of 16 bits, and enable the ASI output channel 1.

Figure 3-6. Audio Configuration

As shown in [Figure 3-7](#), select *AVDD* for the MIC bias voltage and power-up the MIC bias.

Figure 3-7. MIC Bias Configuration

The default state for the PCMx140Q1 is standby mode and, with the exception of the channel digital volume, all device configurations must be done in standby mode. The PCMx140Q1 does not provide a digital audio output in standby mode. [Figure 3-8](#) shows how to change the mode from standby to active.

Figure 3-8. Standby to Active Mode

When active mode is enabled, any controls not configurable in active mode are grayed out. These controls can be changed again when the device is brought out of active mode. [Figure 3-9](#) shows which controls are disabled.

Figure 3-9. Disabled Controls in Active Mode

Audio can now be captured on your PC using the audio program of your choice.

3.2.1 Configuring the Audio Serial Bus for the I²S Output

The PCMx140Q1 features a highly flexible audio serial bus that can be configured to implement a wide range of data formats. The default format is TDM, however the GUI can be used to change the data format to I²S. This section describes how to configure the PCMx140Q1EVM for a 2-channel I²S output to a USB audio at 16 bits and 48 kHz. Configure the AC-MB for USB audio as described in [Section 3.2](#). As shown in [Figure 3-10](#), select the audio serial bus tab.

Figure 3-10. Audio Serial Bus Tab

In the ASI format configuration pane (shown in [Figure 3-11](#)), change the protocol format to I²S, and the word length to 16 bits.

ASI Format Configuration		
Protocol Format	Master/Slave	☐ Data is in Hi-Z for unused cycles
I2S	Slave Mode	☐ Invert FSYNC Polarity
Word Length	Bus Keeper	☐ Invert BCLK Polarity
16 bits	Always Disabled	☐ Invert Data Transmit Edge
Slot 0 Offset		☐ Daisy Chain Devices
0 Cycle		

Figure 3-11. ASI Format Configuration

When the protocol format is changed to I²S in the GUI, the USB audio processor on the AC-MB also changes the audio format to I²S. The GUI reads the ASI status register (page 0 register 0x15), providing the detected sampling rate and BCLK and FSYNC ratio. The ASI status register can also be read manually in the audio serial bus tab by clicking the *Read* button, as shown in [Figure 3-12](#), in the clock monitor pane.

Figure 3-12. Clock Monitor Pane

The default slot assignment for channel 1 is left slot 0 and the default slot assignment for channel 2 is left slot 1. As shown in [Figure 3-13](#), change the channel 2 slot assignment to right slot 0. The diagram at the top of the window updates to display the data format and slots selected.

Figure 3-13. Channel Output Configuration and Diagram

3.2.2

The AC-MB USB audio currently supports only two channels per data line when in I²S mode and the BCLK and FSYNC ratio is fixed at 64. The EVM is now ready for use with the audio recording program of your choice.

3.2.3 Saving a Configuration

To save a configuration, as shown in [Figure 3-14](#), click the upper left corner of the PPC3 window and select **Save**. The configuration is saved as a .ppc3 file. To load a saved configuration, click the upper left corner of the PPC3 window and select **Open**. Navigate to the location of the saved .ppc3 file, and click **Open**.

Figure 3-14. Saving a Configuration in PPC3

3.3 Matlab Audio Capture Example

The driver for the AC-MB can be controlled with Matlab, allowing for some automated testing. The following code demonstrates capturing audio from the AC-MB with Matlab. This example requires the Audio Toolbox™.

```

        if ismac % macOS driver
deviceReader = audioDeviceReader( 'Device', 'TI USB Audio 2.0',...
'SampleRate', 48000, ...
'NumChannels', 8 ,...
'BitDepth', '32-bit float',...
'OutputDataType','double');
elseif ispc % windows driver
deviceReader = audioDeviceReader( 'Driver','ASIO', 'Device', 'Texas Instruments USB Audio ...',...
'SampleRate', 48000, ...
'NumChannels', 8 ,...
'BitDepth', '32-bit float',...
'OutputDataType','double');
end
setup(deviceReader);% Setup the device reader
% Play out a file through PC and capture in the EVM
info = audioinfo( infile_name );% Read audiophile infile_name
fileReader = dsp.AudioFileReader( infile_name );% Create fileReader object
fileInfo = audioinfo(infile_name);% Copy info from infile_name
filewriter = dsp.AudioFileWriter( outfile_name, 'SampleRate', deviceReader.SampleRate, 'DataType',
'int32');% Create filewriter object
audioOut = audioDeviceWriter('SampleRate', fileInfo.SampleRate);% Setup audio playback
setup( audioOut, zeros(deviceReader.SamplesPerFrame, fileInfo.NumChannels) );
while ~isDone(fileReader)% For each block played out, record the block from EVM
audioToPlay = fileReader();% Read a chunk of audio from infile_name
audioOut(audioToPlay);% Play a chunk of audio
[audioRead, numOverrun] = deviceReader();% Grab a chunk of audio from EVM
filewriter(audioRead);% Write the chunk of audio from EVM to a file
end
release(audioOut);% Close all objects
release(fileReader);
release(filewriter);
release(deviceReader);

```

4 Hardware Design Files

4.1 PCMx140Q1EVM-PDK Schematic and Bill of Materials

This section provides the schematics and bill of materials (BOM) for the PCMx140Q1EVM-PDK.

4.1.1 PCMx140Q1EVM-PDK Schematic

Figure 4-1 shows the schematics for the PCMx140Q1EVM-PDK.
