

User's Guide

AM62A Low-Power SK EVM User's Guide

Abstract

This technical user's guide is an excellent resource for those looking to develop applications with TI's AM62A Low-Power SK EVM. This low-cost Starter Kit is built around TI's AM62A AI Vision processor which includes an image signal processor (ISP) supporting 5MP@60FPS, 2 tera-operations-per-second (TOPS) AI Accelerator, Quad-Core 64-bit Arm®-Cortex® A53 microprocessor, Single-Core Arm Cortex-R5F, and H.264/H.265 video encode/decode. The SK-AM62A-LP is an ideal choice for those looking to develop smart camera, dashcam, machine vision camera, and automotive front camera applications.

The starter kit also includes both a MIPI CSI-2 camera connector for a single camera and additional expansion connector for up to 4 cameras, making it suitable for a variety of embedded vision and AI applications on the edge. For a variety of applications, TI's ISP can handle different lighting conditions in video streams by using HDR encoding and RGB-IR camera support. With the help of edge AI, Deep Learning on video streams like image classification and object detection have greatly improved performance on AM62A's AI accelerator. Therefore, giving significant improvement in frame rate, latency, and performance to allow offloading intensive processes from general purpose cores.

Furthermore, the starter kit supports Linux development with feature rich EdgeAI SDK. On-chip emulation logic allows for emulation and debugging using standard development tools such as Code Composer Studio™ from TI.

Note

This evaluation board is a pre-production release and has a few known issues that should not be copied into a production system.

1 EVM Revisions and Assembly Variants

The various AM62A SK EVM PCB design revisions, and assembly variants are listed in the table below. Specific PCB revision is indicated in silkscreen on the PCB. Specific assembly variant is indicated with additional sticker label.

Table 1-1. SK EVM PCB design revisions, and assembly variants

OPN	PCB Revision	Assembly Variant	Revision and Assembly Variant Description
SK-AM62A-LP	PROC135E1	N/A (single variant produced)	First prototype, early release revision of the AM62A SK EVM. Implements the Sitara™ AM62A MPU with a PMIC power solution
SK-AM62A-LP	PROC135E2	N/A	Second prototype, early release revision of the AM62A SK EVM. Implements a number of changes and bug fixes.
SK-AM62A-LP	PROC135E3	N/A	Third prototype. Added 2nd onboard Ethernet port and support for dual core voltage (0.85V and 0.75V)
SK-AM62A-LP	PROC135A	N/A	Production version.

2 Inside the Box

- EVM
- Quick Start Guide

Note

The maximum length of the IO cables shall not exceed 3 meters.

3 EMC, EMI, and ESD Compliance

Components installed on the product are sensitive to Electric Static Discharge (ESD). It is required to use this product in an ESD controlled environment. This may include a temperature and/or humidity controlled environment to limit the buildup of ESD. It is also required to use ESD protection such as wrist straps and ESD mats when interfacing with the product.

The product is used in the basic electromagnetic environment as in laboratory conditions, and the applied standard is as per EN IEC 61326-1:2021.

4.1 Key Features

The AM62A Low Power SK EVM is a high performance, standalone development platform that enables users to evaluate and develop industrial applications for Texas Instrument's AM62A System-on-Chip (SoC).

The following sections discuss the SK EVM's key features.

4.1.1 Processor

AM62A SOC, 18 mm x 18 mm, 0.8 mm pitch, 484-pin FCBGA.

- TLV75510PDQNR– To generate VDD_1V0 for Ethernet PHYs
- TLV75512PDQNR– To generate VDD_1V2 for HDMI Framer
- TPS65931-Q1 (PMIC) – To generate various SoC and Peripheral supplies
- TPS62177 Regulator - Powering the always on circuits of Test Automation Section
- TLV705075YFPT LDO – VDD_CANUART power of SoC
- TPS79601LDO - XDS110 On board emulator
- TPS73533LDO - FT4232 UART to USB Bridge
- TLV7103318DSET LDO – CSI IO supply for MIPI camera boards

Additionally,GPIO from the test automation header is connected to the nPWRON/ ENABLE pin of PMIC to control ON/OFF of the SKEVM via the test automation board. It only disables the VCC_5V0 output of TPS630702RNMR from which several other power supplies are derived.

4.1.3 Memory

- 4GB LPDDR4 supporting data rate up to 4266 Mb/s
- Micro SD Card slot with UHS-1 support
- 1Gbit Octal SPI Flash memory
- 512 Kbit board ID EEPROM
- 16GB eMMC Flash

4.1.4 JTAG Emulator

- XDS110 On-Board Emulator
- Supports 20-pin JTAG connection from external emulator

4.1.5 Supported Interfaces and Peripherals

- 1x USB2.0 Type C Interface, support DFP and UFP modes(Data) and DRP mode(Power)
- 1x USB2.0 Host Interfaces, Type A
- 1x HDMI Interface
- Audio Line In and MIC + Headphone out
- M.2 Key E interface support for both Wi-Fi and Bluetooth modules
- 2x Gigabit Ethernet port supporting 10/100/1000 Mbps data rate on RJ45 connector
- Quad port UART to USB circuit over microB USB connector
- User Test LEDs
- INA devices for current monitoring
- 2x Temperature Sensors near SoC and LPDDR4 for thermal monitoring

4.1.6 Expansion Connectors Headers to Support Application Specific Add On Boards

- CSI 22 Pin Camera flex connector
- CSI MIPI connector
- User Expansion connector
- MCU Header

4.2 Functional Block Diagram

The functional block diagram of the AM62A Low Power SKEVM Board is shown below:

Figure 4-6. Block Diagram - Rev E1 and E2

4.4 Power ON/OFF Procedures

Power to the EVM is provided through an external power supply with PD capability to either of the two USB Type-C Ports.

4.4.1 Power-On Procedure

1. Place the SKEVM boot switch selectors (SW2, SW3) into selected boot mode. Example boot-mode for SD card is shown below.
2. Connect your boot media (if applicable).
3. Attach the PD capable USB Type-C cable to the SKEVM Type-C (J13 or J15) Connector.
4. Connect the other end of the Type-C cable to the source, either AC Power Adapter, or Type C source device (such as a Laptop computer).
5. Visually inspect that either LD4 or LD6 LED should be illuminated.
6. XDS110 JTAG and UART debug console outputs are routed to micro-USB ports J18 and J17, respectively.

Figure 4-8. Example Boot Mode (SD Boot)

4.4.2 Power-Off Procedure

1. Disconnect AC power from AC/DC converter.
2. Remove the USB Type-C cable from the SKEVM.

4.4.3 Power Test Points

Test points for each power output on the board are mentioned in Table 2.

Table 4-2. Power test points

SI #	Power Supply	Test Point	Voltage
------	--------------	------------	---------

Table 4-2. Power test points (continued)

1	VDD_1V2	TP13	1.2

4.5 Peripheral and Major Component Description

The following sections provide an overview of the different interfaces and circuits on the AM62A Low Power SK EVM.

4.5.1 Clocking

The Clock architecture of AM62A-Low Power SK EVM is shown below.

Figure 4-9. Clock architecture

A clock generator of part number LMK1C1104PWR is used to drive the 25MHz clock to the SOC, two Ethernet PHYs & CSI Camera devices. LMK1C1104PWR is a 1:4 LVCMOS clock buffer, which takes the 25MHz crystal/ LVCMOS referenceinput and provides four 25MHz LVCMOS clock outputs. The source for the clock buffer shall be either the CLKOUT0 pin from the SOC or a 25MHz oscillator, the selection of which is made using a set of resistors. By default, an oscillator is used as an input to the clock buffer on the AM62A-Low Power SK EVM. Output Y1 and Y2 of the clock buffer are used as reference clock inputs for the two Gigabit Ethernet PHYs. Output Y3 of the clock buffer is used as a reference clock input for CSI Camera interface.

There is one external crystal (32.768 KHz) attached to the AM62A SOC to provide clock to its WKUP domain.

SOC WKUP DOMAIN

Figure 4-10. SoC WKUP Domain Clock

4.5.1.1 Peripheral Ref Clock

Clock inputs required for peripherals such as XDS110, FT4232, M.2 Interface, HDMI Transmitter and Audio Codec are generated locally using separate crystals or oscillators. Crystals or Oscillators used to provide the reference clocks to the EVM peripherals are shown in the table below.

Table 4-3. Clock Table

Peripheral	Mfr.Part #	Description	Frequency
XDS110 emulator (Y4)	XRCGB16M000FXN01R0	CRY 16.000MHz 8pF SMD	16.000 MHz
FT4232 Bridge (Y5)	445I23D12M00000	CRY12.000MHz 18pF SMD	12.000 MHz
M.2 Interface (U56)	ECS-327MVATX-2-CN-TR	OSC 32.768KHz CMOS SMD	32.768 KHz
Audio Codec (U86)	MC2016Z12.2880C19XSH	OSC12.288MHz CMOS SMD	12.288 MHz
HDMI Transmitter (U9)	MC2016Z12.2880C19XSH	OSC12.288MHz CMOS SMD	12.288 MHz

The clock required by the HDMI Transmitter can be provided by either the on board oscillator or the SOC's AUDIO_EXT_REFCLK1, which can be selected through a resistor mux. SOC's EXT_REFCLK1 is used to provide clock to the User Expansion Connector on the SKEVM. The 32.768 KHz clock to the M.2 module is provided by default from WKUP_CLKOUT0 ball of AM62A SOC.

4.5.2 Reset

The Reset Architecture of AM62A Low Power SK EVM is shown below. The SOC has the following resets:

- RESETSTATz is the Main domain warm reset status output
- PORz_OUT is the Main domain power ON reset status output
- RESET_REQz is the Main domain warm reset input
- MCU_PORz is the MCU domain power ON/ Cold Reset input
- MCU_RESETSTATz is the MCU domain warm reset status output

Upon Power on Reset, all peripheral devices connected to the main domain get reset by RESETSTATz.

Figure 4-11. Reset Block Diagram

4.5.3 CSI Interface

The CSI-2 signals from the AM62A SOC can be connected to a 22 pin FFC connector to interface a CSI-2 standard Camera Card/Module or to a MIPI Connector for FPD Link interface through a 12 Bit Mux/Demux. The FFC & the MIPI connector shares some common auxiliary inputs from the IO Expander.

Table 4 below contains 40 pin Camera MIPI connector pin-out.

Figure 4-12. CSI Interface block diagram

Table 4-4. CSI Camera Connector (J1) Pinout

Pin No	Pin Description	Pin No	Pin Description

4.5.4 Audio Codec Interface

AM62A Low Power SK EVM houses TI's TLV320AIC3106 Stereo Audio Codec to interface with AM62A via McASP1 group of signals.

TLV320AIC3106 is a low-power stereo audio codec with stereo headphone amplifier, as well as multiple inputs and outputs programmable in single ended or fully differential configurations. The record path of the TLV320AIC3106 contains integrated microphone bias, digitally controlled stereo microphone preamplifier and Automatic gain control (AGC) with mix/Mux capability among the multiple analog inputs. The stereo audio DAC supports sampling rates from 8 kHz to 96 kHz.

1x Standard 3.5mm TRRS Audio Jack connector (J14) Mfr. Part# SJ-43514 is provided for MIC IN and Headphone output. Audio Codec's Line inputs are terminated to Test points.

The codec can be configured over I2C with device address set to 0x1B.

The Controller Clock input, MCLK to the Audio Codec is provided through a 12.288MHz Oscillator. Audio serial data bus bit clock (BCLK) & Audio serial data bus input and output (DIN & DOUT) are connected to SOC's MCASP1_AXR0 and MCASP1_AXR2 through a Mux/Demux. An AND output of RESETSTATz and a GPIO sourced via IO expander is used to reset the Audio codec.

The TLV320AIC3106 is powered by an analog supply of 3.3 V, a digital core supply of 1.8 V, and a digital I/O supply of 3.3 V.

Figure 4-13. Audio Codec Interface block diagram

4.5.5 HDMI Display Interface

The DSS (Display Sub system) interface from AM62A SOC is used on the SKEVM to provide a HDMI Interface through a standard Type-A Connector. The SKEVM features a SiI9022A HDMI Transmitter from Lattice semiconductors to convert the 24bit Parallel RGB DSS output stream as well as McASP1 signals to a HDMI-compliant digital audio and video signal.

The Data mapping format used is RGB888. The data bus width is 24-bits.

In order to use the SiI9022A, the SOC needs to setup the device. This is done via the I2C1 interface between the SOC and the SiI9022A. SoC_I2C1 instance connected to the HDMI Transmitter accesses the compatible mode registers, the TPI registers, and the CPI registers. Audio Data is sent from the SOC to HDMI transmitter through the McASP1 instance. HDMI_I2C Bus accesses the EDID and HDCP data on an attached sink device.

TMDS Differential data pairs along with the differential clock signals from the transmitter are connected to the HDMI connector through HDMI ESD device Mfr Part# TPD12S016PWR which also acts as a load switch to limit current supplied to the HDMI connector from board 5V supply.

The HDMI Framer is powered using 3.3V Board IO Supply and 1.2V for the AVCC & DVCC supply by a dedicated LDO.

Figure 4-14. HDMI Interface block diagram

4.5.6 JTAG Interface

The AM62A Low Power SK EVM board includes XDS110 class on board emulation. The connection for this emulator uses an USB 2.0 micro-B connector and the circuit acts as a Bus powered USB device. The VBUS power from the connector is used to power the emulation circuit such that connection to the emulator is not lost when the power to the SKEVM is removed. Voltage translation buffers are used to isolate the XDS110 circuit from the rest of the SKEVM.

Optionally, the JTAG Interface on SKEVM is also provided through a 20 Pin Standard JTAG cTI Header J19. This allows the user to connect an external JTAG Emulator Cable. Voltage translation buffers are used to isolate the JTAG signals of cTI header from the rest of the SKEVM. The output of the voltage translators from XDS110 Section and cTI Header Section are muxed and connected to the AM62A JTAG Interface. If a connection to the cTI 20 Pin JTAG connector is sensed using an auto presence detect circuit, the mux routes the 20 pin signals from the cTI connector to the AM62A SoC in place of the on-board emulation circuit.

Figure 4-15. JTAG Interface block diagram

The pin-out of the cTI 20 pin JTAG connector are given in the table below. A ESD protection part number TPD4E004 is provided on USB signals to steer ESD current pulses to VCC or GND. TPD4E004 protects against ESD pulses up to ± 15 -kV Human-Body Model (HBM) as specified in IEC 61000-4-2 and provides ± 8 -kV contact discharge and ± 12 -kV air-gap discharge.

4.5.7 Test Automation Header

AM62A Low Power SK EVM has a 40 pin test automation header (FH12A-40S-0.5SH) to allow an external controller to manipulate some basic operations like Power Down, POR, Warm Reset, Boot Mode control etc.

The Test Automation Circuit is powered by the 3.3V supply generated by a dedicated Always On regulator Mfr.Part# TPS62177DQCR. The SOC's I2C1 instance is connected to the test automation header. Another I2C instance (BOOTMODE_I2C) from the Test Automation Header is connected to the 24 bit I2C boot mode IO Expander of Mfr. Part# TCA6424ARGJR to allow control of the boot modes for the AM62A SOC.

Figure 4-16. Test Automation Interface block diagram

The test automation circuit has voltage translation circuits so that the controller is isolated from the IO voltages used by the AM62A. Boot mode for the AM62A can be user controlled by either using DIP Switches or the test

automation header through the I2C IO Expander. Boot Mode Buffers are used to isolate the Boot Mode controls driven through DIP Switches or I2C IO Expander. The boot mode can be set using two 8-bit DIP switches on the board, which will connect a pull-up resistor to the output of a buffer when the switch is set to the ON position and to a weaker pull-down resistor when set to the OFF position. The output of the buffer is connected to the boot mode pins on the AM62A SOC and the output is enabled when the boot mode is needed during a reset cycle.

When boot mode is set through Test Automation header, the required switch values are set at the I2C IO expander output, which overwrites the DIP switch values to give the desired boot values to the SOC. The pins used for boot mode also have other functions which are automatically isolated by disabling the boot mode buffer during normal operation.

The power down signal from the Test automation header instructs the SKEVM to power down all the rails except for dedicated power supplies on the board. Similarly PORZn signal provides a hard reset to the SOC and WARM_RESETh for a warm reset to the SOC.

Pin no.	Signal	IO Direction	Pin no.	Signal	IO Direction

4.5.8 UART Interface

The four UART ports of the SOC (MCU UART0, WKUP UART0, SOC UART0 and SOC UART1) are interfaced with an FTDI Bridge FT4232HL for UART-to-USB functionality and then terminated on a USB micro-B connector (J17) on board. When the AM62A Low Power SK EVM is connected to a Host using USB cable, the computer can establish a Virtual COM Port which can be used with any terminal emulation application. The FT4232HL device is bus powered.

Since the circuit is powered through the USB BUS, the connection to the COM port will not be lost when the SKEVM power is removed.

Table 4-6. UART Interface

UART Port	USB to UART Bridge	USB Connector	COM Port
SOC_UART0	FT4232HL	J17	COM1
SOC_UART1			COM2
WKUP_UART0			COM3
MCU_UART0			COM4

The FT4232 chip is configured to operate in 'Single chip USB to four channel UART' mode using the configuration file from an external SPI EEPROM connected to it. The EEPROM (93LC46B) supports 1 Mbit/s clockrate. The EEPROM is programmable in-circuit over USB using a utility program called FT_PROG available from FTDI's web site. The FT_PROG is also used for programming the board serial number for users to identify the connected COM port with board serial number when one or more boards are connected to the computer.

Figure 4-17. UART Interface block diagram

4.5.9 USB Interface

4.5.9.1 USB 2.0 Type A Interface

USB2.0 data lines from Type A connector J7 are connected to the USB1 interface of the AM62A SOC to provide USB high-speed/full-speed communication. USB1_VBUS to the SOC is provided through a resistor divider

network to support (5V-30V) VBUS operation. USB1_DRVVBUS from SOC is connected to the enable pin of Load switch Mfr Part # TPD3S014DBVR to allow on board 5V supply to power the VBUS.

A common mode choke of Mfr Part# DLW21SZ900HQ2B is provided on USB Data lines for EMI/ EMC reduction. USB Data lines from Type-A connectors are also connected to the Current Limit Load Switch and ESD Protection IC Mfr Part# TPD3S014DBVR. This switch limits the current to 500mA and dissipates the ESD strikes above the maximum level specified in the IEC 61000-4-2.

Figure 4-18. USB Type A interface block diagram

4.5.9.2 USB 2.0 Type C Interface

On SKEVM, USB 2.0 Interface is offered through USB Type-C Connector J15 Mfr part# 2012670005 which supports data rate up to 480Mbps. J15 can be used for data communication and also as a power connector sourcing supply to the low power SK EVM. It is configured as DRP port using PD controller TPS65988DHRSHR IC. So it can act as either a Host or Device. Role of the port depends on the type of the device getting connected on the connector and its ability to either sink or source. When the port is acting as DFP, it can source up to 5V @500mA.

USB2.0 Data lines from J15 are provided with a choke and an ESD protection device. USB0_VBUS to the SOC is provided through a resistor divider network to support (5V-30V) VBUS operation.

A common mode choke of Mfr Part# DLW21SZ900HQ2B is provided on USB Data lines for EMI/ EMC reduction. An ESD protection device of part number ESD122DMXR is included to dissipate ESD strikes on USB2.0 DP/DM signals. An ESD protection device of part number TPD1E01B04DPLT is included on CC signals and TVS2200DRVR IC is included on VBUS rail of Type-C Connector J15 to dissipate ESD strikes.

Figure 4-19. USB2.0 Type C Interface Block Diagram

4.5.10 Memory Interfaces

4.5.10.1 LPDDR4 Interface

AM62A Low Power SK EVM houses Micron's (MT53E2G32D4DE-046) dual Rank dual Die 4GB, 32 bit wide LPDDR4 memory supporting data rates up to 4266 Mb/s. The LPDDR4 memory is placed optimally and routed to the DDR0 group of SOC to support point to point communication.

The LPDDR4 memory requires 1.8V for its core supply, thus reducing power demand. The I/Os are supplied from a 1.1V supply output from the PMIC. LPDDR4 reset (Active low) controlled by the AM62A SOC is pulled down to set the default active state. The provision for mounting a pull up resistor is also provided.

Figure 4-20. LPDDR4 Interface Block Diagram

4.5.10.2 OSPI Interface

AM62A Low Power SK EVM board features a 1-Gbit OSPI memory device from Cypress Part# W35N01JWTBAG which is connected to the OSPI0 interface of the AM62A SOC. The OSPI interface supports single and double data rates with clock speeds up to 166 Mhz STR and 120Mhz DTR.

OSPI & QSPI implementation: 0 ohm resistors are provided for DATA[7:0], DQS, INT# and CLK signals. Footprints to mount external pull up resistors are provided on DATA[7:0] to prevent bus floating. The footprint for the OSPI memory also allows the installation of either a QSPI memory or an OSPI memory. The 0 ohm series resistors provided for pins OSPI_DATA[4:7] can be removed if a QSPI Flash is to be mounted.

Reset: The reset for the OSPI flash is connected to a circuit that ANDs the RESETSTATz from the AM62A SOC with the signal GPIO_OSPI_RSTn from the SOC. A pull-up resistor is provided on GPIO_OSPI_RSTn to set the default active state.

Power: Both VCC and VCCQ pins of the OSPI Flash memory is supplied through an on board 1.8V system power. The OSPI I/O group is powered by the VDDSHV1 domain of SOC and is also connected to 1.8V system power.

Figure 4-21. OSPI Interface Block Diagram

4.5.10.3 MMC Interfaces

The AM62A SOC features three MMC ports (MMC0, MMC1 and MMC2). MMC0 is connected to eMMC, MMC1 is interfaced with a Micro SD Card connector and MMC2 is terminated to a connector for M.2 form factored Wi-Fi and BT Module Interface.

4.5.10.3.1 MMC0 - eMMC Interface

The SKEVM board contains 16GB of eMMC flash memory from Micron Part# MTFC16GAPALBH-IT connected to MMC0 port of the AM62A SOC.

The flash is connected to 8 bits of the MMC0 interface supporting HS400 double data rates up to 200MHz. The Micron eMMC is a communication and mass data storage device that includes a Multimedia Card (MMC) interface and a NAND Flash component. Option to mount external pull up resistors are provided on DAT[7:1] to prevent bus floating and series resistor is provided for CLK signal close to SOC pad to match the characteristic impedance of PCB.

The eMMC device requires two power supplies, 3.3V for NAND memory and 1.8V for the eMMC interface. The MMC0 interface of the SOC is powered by the VDDSHV4 power domain, which is connected to 1.8V IO supply.

eMMC device requires active low reset from host. By default, the RST_n signal is temporarily disabled in the device. The host must set ECSD register byte 162, bits[1:0] to 0x1 to enable this functionality before the host can use it. The External Reset is provided by ANDing RESETSTATz from SOC and a GPIO from IO Expander. A pull up is provided on GPIO pin to set the default active state.

Figure 4-22. EMMC Interface block diagram

4.5.10.3.2 MMC1 - Micro SD Interface

The SKEVM board provides a micro SD card interface connected to the MMC1 port of the AM62A SOC. The MicroSD card socket of Mfr. Part# MEM2051-00-195-00-A is used to support this interfacing. UHS1 operation is supported, including IO operations at both 1.8V and 3.3V. The Micro SD card interface is set to operate in SD mode by default. For high-speed cards, the ROM Code of the SOC attempts to find the fastest speed that the card and controller can support and then have a transition to 1.8V through a VSEL_SD_SOC signal.

The SD Card connector power is provided using a load switch of Mfr. Part # TPS22918DBVR, which is controlled by ANDing the output of RESETSTATz, PORz_OUT and a GPIO from IO Expander.

An ESD protection device of part number TPD6E001RSE is provided for data, clock, and command signals. TPD6E001RSE is a line termination device with integrated TVS diodes providing system-level IEC 61000-4-2 ESD protection, ± 8 -kV contact discharge and ± 15 kV air-gap discharge.

Figure 4-23. Micro SD Interface block diagram

4.5.10.3.3 MMC2 - M.2 Key E Interface

AM62A Low Power SK EVM has a M.2 Key E interface for connecting WiFi BT modules connected to MMC2, UART2 instances and McASP1 interface through buffers. This can be used to interface with a Wi-Fi, dual-band, 2.4 and 5-GHz module with antennas supporting Industrial temperature grade. The M.2 is provided with 4-bit IO of the MMC2 interface supporting IEEE standard 802.11a/b/g/n data. The M.2 connector can be interfaced with modules that can offer high throughput and extended range along with Wi-Fi and Bluetooth coexistence for a power-optimized design.

The M.2 Connector is provided with a 3.3 V on board power supply to meet the power supply requirements of the interfacing modules. The MMC2 interface of the SOC is powered by the VDDSHV6 power domain, which is connected to 1.8V IO supply.

Figure 4-24. M.2 Key E Interface block diagram

4.5.10.4 Board ID EEPROM

AM62A Low Power SK EVM boards can be identified remotely from its version and serial number data stored on the onboard EEPROM.

Board ID memory AT24C512C-MAHM-T from Microchip is interfaced to the I2C0 port of the SOC and is configured to respond to address 0x51 programmed with the header description. I2C address of the EEPROM can be modified by driving the A0 pin to high and A1, A2 pins to LOW. The first 259 bytes of memory are preprogrammed with identification information for each board. The remaining 65277 bytes are available to the user for data or code storage.

Figure 4-25. Board ID EEPROM Block Diagram

4.5.11 Ethernet Interface

The AM62A Low Power SK EVM offers two Ethernet Ports of 1 Gigabit Speed for external Communication.

RGMII1 and RGMII2 Gigabit Ethernet CPSW Port from AM62A SOC is connected to the On-Board PHY Transceiver DP83867.

CPSW_RGMII1 and CPSW_RGMII2 Ports share a common MDIO Bus to communicate with the external PHY Transceiver.

Note

RGMII2 modular connector in E1 and E2 version EVM is descope.

Figure 4-26. Ethernet Interface block diagram - Rev E1 and E2

Figure 4-27. Ethernet Interface block diagram - Rev E3 and A

4.5.11.1 CPSW Ethernet PHY Default Configuration

The default configuration of the DP83867 is determined using a number of resistor pull-up and pull-down values on specific pins of the PHY. Depending on the values installed, each of the configuration pins can be set to one of four modes. The AM62A Low Power SK EVM uses the 48-pin QFN package which supports the RGMII interface.

The DP83867 PHY uses four level configurations based on resistor strapping which generate four distinct voltages ranges. The resistors are connected to the RX data and control pins which are normally driven by the PHY and are inputs to the processor. The voltage range for each mode is shown below:

Mode1 - 0V to 0.3V

Mode 2 – 0.462V to 0.6303V

Mode3 – 0.7425V to 0.9372V

Mode4 – 2.2902V to 2.9304V

Footprints for both pull-up and pull-down is provided on all the strapping pins except LED_0. LED_0 is for Mirror Enable, which is set to Mode1 by default, Mode4 is not applicable and Mode2, Mode3 option is not desired. The PHY is resistor strapped for the below configurations:

PHY ADDR: 00000

Auto_neg: Enabled

ANG_SEL : 10/100/1000

RGMII TXCLK skew : 0 ns

RGMII RXCLK skew : 2 ns

Table 4-7. CPSW Ethernet Strap Settings

Strap Setting	Pin Name	Strap Function	Mode	Value of Strap Function	Description
PHY Address	RX_D2	PHY_AD3	1	0	PHY Address: 0000
		PHY_AD2	1	0	
	RX_D0	PHY_AD1	1	0	
		PHY_AD0	1	0

		RGMII Clock Skew TX[0]	5	0	
	LED_1	RGMII Clock Skew TX[2]	5	1	
		ANEG_SEL	1	0	Advertiseability of 10/100/1000
	LED_0	Mirror Enable	1	0	Mirror Enable Disabled
	GPIO_1	RGMII Clock Skew RX[2]	1	0	RGMII RX Clock Skew is set to 2 ns
		RGMII Clock Skew TX[1]	1	0	
	GPIO_0	RGMII Clock Skew RX[0]	1	0	

4.5.12 GPIO Port Expander

The I/O Expanders used in the AM62A Low Power SKEVM is a 24-Bit I2C based I/O Expander which is used for daughter cards plug-in detection and for generating resets and enable signals to various peripheral devices connected to it. The SoC_I2C1 bus of the AM62A SOC is used to interface with the I/O Expanders. The I2C device addresses of the I/O Expander are 0x21 and 0x23. See Table 10 below for the list of signals being controlled by the Expander.

IO EXPANDER - 01

Figure 4-28. Mapping of AM62A SoC with AM62A Low Power SK EVM peripherals

4.5.14 Power

4.5.14.1 Power Requirements

AM62A Low Power SK EVM can be powered through either of the two USB Type C Connectors –

- Connector1(J13) - Power role – SINK, No Data role
- Connector2(J15) - Power role – DRP, Data role – USB 2.0 DFP or UFP

The AM62A SK EVM supports voltage input ranges of 5V - 15V and 3A of current. A USB PD controller Mfr. Part# TPS65988DHRSHR is used for PD negotiation upon cable detection to get necessary power required for the board. Connector 1 is configured to be an UFP Port and has no Data role. Connector 2 is configured as a DRP port, it can act as DFP only when the board is being powered by Connector 1. When both the connectors are connected to external power supply, the port with highest PD power contract will be selected to power the board.

Table 4-8. Type-C Power Roles

J13 (UFP)	J15 (DRP)	BoardPower	Remarks
Plugged in	NC	ON - J13	J13 will be UFP and will only sink power & J15 can act as DFP if a peripheral is connected

Table 4-8. Type-C Power Roles (continued)

NC	Plugged in	ON - J15	J15 will be UFP and can only sink power
Plugged in	Plugged in	ON- J13 or J15	Board will be powered by the port with highest PD power contract

The PD IC uses a SPI EEPROM to load the necessary configuration on power up so it can negotiate a power contract with a compatible power source.

The configuration file is loaded to the EEPROM using header J11. Once the EEPROM is programmed the PD obtains the configuration files via SPI communication. Upon loading the configuration files the PD negotiates with the source to obtain the necessary power requirement.

Note

The EEPROM is pre-programmed with the configuration file for the operation of the PD controller.

Power indication LEDs are provided for both the Type-C connectors for the user to identify which connector is powering the SKEVM Board. An external power supply (Type-C output) can be used to power the EVM but is not included as part of the SKEVM kit.

The external power supply requirements (Type-C) are:

Minimum Voltage: 5 VDC, Recommended Minimum Current: 3000 mA

Maximum Voltage: 15VDC, Maximum current: 5000mA

Table 4-9. Recommended Power Supplies

Manufacturer	Manufacturer Part #
GlobTek, Inc.	TR9CZ3000USBCG2R6BF2
Qualtek	QADC-65-20-08CB

Note

Because SK-AM62A implements USB PD for power, the device is able to negotiate to the highest Voltage/Current combination supported by both the Device and Power Adapter, as such, if the power supply exceeds the maximum voltage and current requirements listed above is acceptable as long as the power adapter is compliant with the USB-C PD specification.

Note

TI recommends using an external power supply or power accessory which complies with applicable regional safety standards such as (by example) UL, CSA, VDE, CCC, PSE, etc.

4.5.14.2 Power Input

Both Type-C Connectors (VBUS and CC lines) are connected to a Dual PD controller Mfr Part# TPS65988. The TPS65988 is a stand-alone USB Type-C and Power Delivery (PD) controller providing cable plug and orientation detection for two USB Type-C Connectors. Upon cable detection, the TPS65988 communicates on the CC wire using the USB PD protocol. When cable detection and USB PD negotiation are complete, the TPS65988 enables the appropriate power path. The two internal power paths of TPS65988 are configured as sink paths for the two Type-C ports and an external FET path is provided for Type-C CONN 2 to source 5V when acting as DFP. The external FET path is controlled by GPIO17/PP_EXT2 of the PD controller along with a resistor option to also enable using USB0 DRVVBUS from AM62A SOC. TPS65988 PD controller can provide an output of 3A (15V max) through CC negotiation. The VBUS pins from both the Type C connectors are connected to the VBUS pins of the PD controller. The output of the PD is VMAIN which is supplied to on board Buck-Boost and Buck regulators to generate fixed 5V and 3.3V supply for the SKEVM board.

Figure 4-29. Power Input block diagram

4.5.14.3 Power Supply

AM62A Low Power SK EVM utilizes an array of DC-DC converters to supply the various memories, clocks, SOC and other components on the board with the necessary voltage and the power required.

The figure below shows the various discrete regulators, PMIC and LDOs used to generate power rails and the current consumption of each peripheral on AM62A Low Power SK EVM board.

Figure 4-30. Power Architecture

The following sections describe the power distribution network topology that supplies the SKEVM board, supporting components and reference voltages.

The AM62A Low Power SK EVM board includes a power solution based on combination of PMIC and discrete power supply components. The initial stage of the power supply will be VBUS voltage from either of the two USB Type C connectors J13 and J15. USB Type-C Dual PD controller of Mfr. Part# TPS65988DHRSHR is used for negotiation of the required power to the system.

Buck-Boost controller TPS630702RNMR and Buck converter LM5141-Q1 are used for the generation of 5V and 3.3V respectively and the input to the regulators is the PD output. These 3.3V and 5V are the primary voltages for the AM62A Low Power SK EVM Board power resources. The 3.3V supply generated from the Buck regulator LM5141-Q1 is the input supply to the PMIC, various SOC regulators and LDOs. The 5V supply generated from the Buck Boost regulator TPS630702RNMR is used for powering the onboard peripherals. Discrete regulators and LDOs used on Board are:

- TPS62824DMQR– To generate VDD_2V5 rail for PHY and DDR peripherals
- TLV75510PDQNR– To generate VDD_1V0 for Ethernet PHYs
- TLV75512PDQNR– To generate VDD_1V2 for HDMI Framer
- TPS65931-Q1 (PMIC) – To generate various SoC and Peripheral supplies
- TPS62177 Regulator - Powering the always on circuits of Test Automation Section
- TLV705075YFPT LDO – VDD_CANUART power of SoC
- TPS79601LDO - XDS110 On board emulator
- TPS73533LDO - FT4232 UART to USB Bridge

- TLV7103318DSET LDO – CSI IO supply for MIPI camera boards

Additionally,GPIO from the test automation header is connected to the nPWRON/ ENABLE pin of PMIC to control ON/OFF of the SKEVM via the test automation board. It only disables the VCC_5V0 output of TPS630702RNMR from which several other power supplies are derived.

4.5.14.4 AM62A SoC Power

The Core voltage of the AM62A SOC can be 0.75 V or 0.85 V based on the PMIC Configuration and on the power optimization requirement. By Default the PMIC is configured to supply VDD_CORE to 0.75V. It can be changed to 0.85V by changing the PMIC Configuration register. Current monitors are provided on all the SOC Power rails.

The SOC has different IO groups. Each IO group is powered by specific power supplies as listed in the table below:

Table 4-10. Soc Power Supply

Sl.No	Power Supply	SoC Supply Rails	IO Power Group	Voltage
1	VDD_CORE	VDDA_CORE_USB	USB	0.75/ 0.85
		VDDA_CORE_CSI	CSI	
		VDD_CANUART	CANUART	
		VDD_CORE	CORE	
2	VDDR_CORE	VDDR_CORE	CORE	0.85
3	VDDA_1V8	VDDA_1V8_CSIRX	CSI	1.8
		VDDA_1V8_USB	USB	
		VDDA_1V8_MCU	MCU GENERAL

4.5.14.5 Current Monitoring

INA231 power monitor devices are used to monitor current and voltage of various power rails of AM62A Low Power processor.The INA231 interfaces to the AM62A Low Power through I2C interface (SoC_I2C1). Four terminal, high precision shunt resistors are provided to measure load current.

Table 4-11. INA I2C Device Addresses

Source	Supply net	DeviceAddress	Value of the Shunt Connected to the Supply Rail
VCC_CORE	VDD_CORE	0x40	1mΩ± 1%
VCC_0V85	VDDR_CORE	0x41	10mΩ± 1%

Table 4-11. INA I2C Device Addresses (continued)

VCC_3V3_SYS	SoC_DVDD3V3	0x4C	10mΩ± 1%
VCC1V8_SYS	SoC_DVDD1V8	0x45	10mΩ± 1%
VDDA1V8	VDDA_1V8	0x4D	10mΩ± 1%
VCC1V1	VDD_LPDDR4	0x47	1mΩ± 1%

4.5.15 AM62A Low Power SK EVM User Setup and Configuration

4.5.15.1 Boot Modes

The boot mode for the SK EVM board is defined by two banks of switches SW2 and SW3 or by the I2C buffer connected to the Test automation connector. This allows for AM62A SOC Boot mode control by either the user (DIP Switch Control) or by the Test Automation connector.

All the bits of switch (SW2 & SW3) have weak pull down resistor and a strong pull up resistor as shown in below picture. Note that OFF setting provides a low logic level ('0') and an ON setting provide a high logic level ('1').

The boot mode pins of the SOC have associated alternate functions during normal operation. Hence isolation is provided using Buffer IC's to cater for alternate pin functionality. The output of the buffer is connected to the boot mode pins on the AM62A SOC and the output is enabled only when the boot mode is needed during a reset cycle.

The input to the buffer is connected to the DIP switch circuit and to the output of an I2C IO Expander set by the test automation circuit. If the test automation circuit controls the boot mode, all the switches should be manually set to the OFF position. The boot mode buffer is powered by an always ON power supply to ensure that the boot mode remains present even if the SOC is power cycled.

Switch SW2 and SW3 bits [15:0] are used to set the SOC Boot mode.

The switch map to the boot mode functions is provided in the tables below.

Table 4-12. Bootmode Pin Strapping

4.5.15.2 User Test LEDs

TheAM62A Low Power SK EVM board contains two LEDs for user defined functions.

The table below indicates the User test LEDs and the associated GPIOs used to control it.

SI #	LED	GPIO used	SCHNet Names
1	LD1	GPIO1_49	SOC_GPIO1_49
2	LD5	U92.24(P27)	IO_EXP_TEST_LED

4.5.16 Expansion Headers

The AM62A Low Power SK EVM features two expansion Headers, 40 pin User expansion connector & 28 pin MCU Header.

4.5.16.1 User Expansion Connector

The AM62A Low Power SK EVM supports RPi expansion interface using a 40-pin User expansion connector Mfr. Part# PEC20DAAN. Three mounting holes are oriented with the connector to allow for connection of these HAT boards.

The following interfaces and IOs are included on to the 40 pin User Expansion connector:

- 2x SPI : SPI0 with 2 CS and SPI2 with 3 CS
- 2x I2C: SoC_I2C0 and SoC_I2C2
- 1x UART: UART5
- 2x PWM: EHRPWM0_A, EHRPWM1_B
- 1x CLK: CLKOUT0
- 10x GPIO: GPIOs from main domain
- 5V and 3.3V supply (current limited to 155mA and 500mA)

Each of the power supplies 5V and 3.3V are current limited to 155mA and 500mA respectively. This is achieved by using two individual load switch TPS22902YFPR and TPS22946YZPR. Enable for the load switches are controllable by an I2C based GPIO Port expander.

Signals routed from User Expansion connector are listed in the table below.

4.5.16.2 MCU Connector

AM62A Low Power SK EVM has a 14 x 2 standard 0.1" spaced MCU connector which includes signals connected to the MCU Domain of the SOC. The connected signals include MCU_I2C0, MCU_UART0 (with flow control), MCU_SPI0 and MCU_MCAN0 signals. Additional control signals connected on the Header includes CONN_MCU_RESETz, CONN_MCU_PORz, MCU_RESETSTATz, MCU_SAFETY_ERRORn, 3.3V IO supply and GND. MCU_UART0 signals from AM62A SOC are connected to both MCU Header and FT4232 Bridge through a MUX Mfr Part # SN74CB3Q3257PWR. The MCU Header does not include the Board ID memory interface. Allowed current limit is 100mA on 3.3V rail.

4.5.17 I2C Address Mapping

There are four I2C interfaces used in SK EVM board:

- SoC_I2C0 Interface: SoC I2C[0] is connected to Board ID EEPROM, User Expansion Connector Header, USB PD controller and PMIC
- SOC_I2C1 Interface: SoC I2C[1] is connected to Test Automation Header, Current Monitors (x6), Temperature Sensors (x2), Audio Codec, HDMI Transmitter & GPIO Port Expander (x2).
- SOC_I2C2 Interface: SoC I2C[2] is connected to the User Expansion Connector Header and both the CSI Camera connectors (Flex & MIPI).
- MCUI2C0 Interface: MCU I2C[0] is connected to the MCU Header & PMIC.

The image below depicts the I2C tree, and Table 25 below provides the complete I2C address mapping details present on the AM62A Low Power SK EVM.
